TDI indicator for Mobile

Here is how to include the full TDI indicator with Volatility Bands and Market Base Line on your mobile or tablet version of MT4 (or any other platform that doesn't have the TDI).

1. Insert an RSI with the color set to your background color or to "None" if you have that option.
2. Set the RSI period to "13", Apply it to "Close".
3. Insert a Moving Average into the RSI's indicator window and set that period to "2", "Simple", apply it to "Previous Indicator's Data" and make that line Green.
4. Insert another Moving Average into the RSI's indicator window and set that period to "7", "Simple", apply it to "Previous Indicator's Data" and make that line Red.
5. Insert a Bollinger Band into the RSI's indicator window and set that to "34" with a deviation of "1.619", apply it to "First Indicator's Data" and set that line to Blue.
6. Inset a Moving Average again into the RSI's indicator window and set it to "34", "Simple", apply it to "First Indicator's Data" and set that line to Yellow.

And there you have it. The complete TDI for your mobile, tablet or any other platform
