dove_alliance :

For those who are interested in using the simulator I will upload it on this post. I got this simulator from a trader here on the FF back in late 2007 and it works very well and is used on the Strategy Tester of your platform.

Instruction:

Open up the zip and copy, paste the LFH_Trading_Simulator_3 in to your Expert Adviser folder. Close and reboot your MT4.

You now must create a template for the simulator. You do this by taking the H1 chart and rename it Simulator or Offline and save into your template folder.

Now you need a new profile but before you do be sure the Paradox charts are already named in a profile. If you haven't name the Paradox charts then go to File; scroll to Profile; click on Save As and a window will appear in which you give the Paradox a name(such as The Paradox System) then click OK.

Next; click on File, scroll to profile and click on Default and the default profile will show. Go to File, Profile and click Save AS and rename it Simulator and click OK. Then delete all charts in this new profile. You now have an empty Simulator Profile.

Starting the Simulator. You must be offline for this to work:

Click on File, New Chart and scroll for the EURJPY and click. You now have the E/J H1 chart. Next; click View on the menu bar; scroll to Strategy Tester and click. The tester will show on the bottom of your platform. The picture below shows you how to set it up, I suggest on the date you go no longer than a week at a time so you're not waiting for the data to load.

Once you have it set up then click the Start button. You may have to wait on the data to load and once that is done a visual chart will then start. You then right click on the chart; go to template and click on the template you named for the simulator.

You are now running in Simulator.

shinny:

Hello Traders

Here is my trade (on EURJPY) from today:

2hr Chart:

Sar attachment at the EMA, MACD still up. Pretty self explanatory trade (I hope!).

Also, here is a GBPUSD trade I opened last night.

Its quite an interesting situation, as you can see:

Here is the Daily Chart:

As you can see the market has been quite tight, so I have been buying the bottom and selling the top. Once it was clear of the market turning over, I have mainly been selling, trying to catch a breakout down, but the ranging has still been in.

Here is the 2hr Chart:

Here we have ROMAR running through the centre, and it looks pretty nasty. The entry I took (with the arrow) we had the SAR attachment at the PSAR, with a bar going through ROMAR.

With the Daily PSAR flipped for the down, and EMA/Purple, why did I buy? Well I still had the 2hr Fib up, MACD up, and Magenta divergence had shown at the top. I had a SAR attachment on the bottom, so I knew the next connection was on the top. I had 55 pips from my entry to the last high to bring out the hidden divergence, so if I got a LH I still had room to get +40.

What obviously happened is the SAR attached on the top, then there was that one crazy 92 pip 2hr bar. The fib had already flipped itself at what was the 61.8.

It wasn't an easy trade because of the 2hr ROMAR/EMA been like they are, so close together, but the 2hr bar going through them and the SAR was telling me it was only going North either for a LH or a HH and Divergence showing ready for the Daily Consolidated downtrend to begin again.

That spike high was also at the Daily PSAR, literally to the pip, which shows how strong it is.

GBP/USD	Buy	15/05/2017 18:00:05.208	16/05/2017 10:01:05.969	1.23981	1.23285	40.4
---------	-----	-------------------------	-------------------------	---------	---------	------

+++++

dove_alliance :

The Daily chart works precisely the same as the H2. Only difference is you get one Daily bar per 24 hours. At the end of my tutorial I had explained what happened last Friday with the SAR attachment on the Daily. I also stated because of the Daily SAR ranging was ending. I also told you on Sunday's opening I took the entry going long and took profit at the top.

You had a full blown uptrend with both the Daily and the H2 Sunday's opening. The H2 is still in a full blown uptrend. So the question is how do you enter into the uptrend? The answer is one of three ways.

1. You can wait on a retrace bar outside of Purple and and take the next candle for entry.
2. If you are inside Purple with a slider you wait on the EMA hit and take entry back into the trend.
4. If the SAR attaches with a bar in the trend you take entry.

Because this market had went up 220 pips since Sunday - I would be careful with this Smooth hit at this time because it is after 12 noon EST and trading is pretty much over with until the opening at 17:00 EST. I would say it is about time for another slider and/or the Parabolic flip on this H2. Bottom line - just be patient.

Just to be sure, it is hard for me sometimes but want to make my notes accurate: 1. "Retrace bar outside of Purple" means a touch of purple for H2 balance without closing in the other side of Purple? I took a picture to illustrate my question: {image} Therefore in 2. "inside Purple" means that candle crossed it and closed on the other side, as is happening right now in H2, right? Thanks in advance and best regards, Pablo.

One other thing Pablo. Always focus on support and resistance. In your scenario you have Purple as support in an uptrend. This means the hit on Purple support was the entry.

[illegible]

shinny:

Hello Traders

Here is my trade from today (EURJPY).

2hr Chart:

Entry was at the open at Purple, with the SAR attached at the bottom. Market was heading to Support at ROMAR. If I was up and about earlier I would have sold after the MACD arrow down - there was no way we were having a slider there, Purple was gliding through the other 4 horsemen and PSAR was a certainty to flip. As it was, because I occasionally like to sleep, the next best entry at that time was the consolidation and open at Purple. You quite often see that with the market turning into the downtrend.

Here is the print:

I was actually a few pips late getting in as I wasn't 100% focused. We have my Mother & Father In Law here, and its my Wife and my Father in Laws Birthdays today, so I didnt get the fill on the first leg down for +40, I had to wait until later to fill the tp.

+++++

Hendo

Hello Traders,

Hey Shaun, I know what you mean about a busy Mother's Day. Just finished up here in the states. It seems to be a two day affair, and was quite fun for the wonderful women in my life.

Stayed up late and took the same trade. Here is my plan with screen shot with detailed explanation with regards to entry.

Session Sydney: EUR - JPY 5/16/2017

Daily: Open 53 pips above Purple.

ROMAR: Support

EMA: Support

Parabolic: Support

Notes: Four Horsemen up. DB / SAR, up with PURPLE and GREEN DIVERGENCE attach at 0.00 FIBO.

Trend EMA arrow up. MACD zero cross arrow down. FIBO down.

H2

ROMAR: Support

EMA: Support

Parabolic: Eliminated

Notes: Four Horsemen up. Purple crossed White down, eliminating PSAR. EMA holding support. DB /SAR up with PURPLE and GREEN DIVERGENCE attach and SAR price tag. SAR attach below PSAR. Trend EMA arrow down. MACD zero cross arrow down. FIBO down.

H1

ROMAR: Support

EMA: Resistance

Parabolic: Resistance

Notes: EMA crossed Purple and White down. MACD zero cross arrow down Trend EMA arrow down. MA crossover arrow down. FIBO down.

FINAL NOTES: H1 down. H2 up, however, turning down. Daily up and out of balance with Purple. Market is in consolidation. H2 open candle dropped 27 pips to SAR attach. Next open candle should be significantly below PSAR, indicating a turn down. I expect it will continue down and SAR will turn DB. I will wait for possible H2 turn down, then wait for EMA to cross Purple, with PSAR flip and enter short on open candle or retrace to Purple.

Adjustment: H2 PSAR flipped for the down. EMA crossed Purple.

Short: Entered short on H2 open candle at Purple.

Result: Took +40 from the market.

+++++

Hello Traders,

I have not been at my trade station and had the opportunity to trade this scenario. I would loved to have entered this trade on the Daily EMA SAR hit however, the spread spiked at that moment. So I had to carry on with my plan if it did. This was not a comfortable entry, I prefer to enter as low as possible. With that said I can say with confidence my faith in the Paradox is absolute so, I let the Paradox take over then took my youngest daughter out for a walk and returned with my +40.

It's getting to be a lot of fun to start seeing into the future. At first I had a very hard time accepting that statement Dana would make quite often. There is no better feeling to get to that level as a trader.

Here is my plan with screen shots of the H2 as well as Daily.

Session Sydney: EUR - JPY 5/17/2017

Daily: Open 24 pips above EMA.

ROMAR: Support

EMA: Support

Parabolic: Support

Notes: Four Horsemen up. Purple in tight slider with White and Smooth. DB / SAR, up with PURPLE and GREEN DIVERGENCE attach at 0.00 FIBO. Trend EMA arrow up. MACD zero cross arrow down. FIBO down. Ranging.

H2

ROMAR: Support

EMA: Resistance

Parabolic: Resistance

Notes: Four Horsemen steep down. DB down with BLUE DIVERGENCE attach and SAR price tag near 100.0 FIBO. Trend EMA arrow down. MACD zero cross arrow down. FIBO down.

H1

ROMAR: Resistance

EMA: Resistance

Parabolic: Resistance

Notes: Four Horsemen steep down. MACD zero cross arrow down Trend EMA arrow down. MA crossover arrow down. FIBO up.

Result: Took +40 pips from the market

$\epsilon \leq f_Y(\epsilon) \leq f_X(\epsilon)$

May 19, 2017 – pg 473

dove_alliance :

Traders - you are all missing the boat. My tutorial was about the DB, SAR, and the FIBO. Taking a look at this Daily snippet you see the SAR hit bottom which was also bottom of the H2 Fibo for a reversal. Then hit top at the BB flat band, which was also the top of the H2 Fibo for a reversal. Then hit the Parabolic which was also the bottom of the H2 Fibo for a reversal. If you had payed attention to the Tutorial then you would know I was showing you how to trade from top to bottom, and from bottom to top of the H2 Fibo using the DB and SAR in ranging.

Hendo

Hello Traders,

Here is last nights trade plan with screen shot. Had to make an adjustment in the moment, and is noted for you!

Session Sydney: EUR - JPY 5/18/2017

Daily: 14 pips above EMA support.

ROMAR: Support

EMA: Support

Parabolic: Support

Notes: Four Horsemen up. Purple in tight slider with White and Smooth. DB down with GOLD and BLUE DIVERGENCE attach below 23.6 FIBO. Trend EMA arrow down. MACD zero cross arrow down. FIBO down. Ranging.

H2

ROMAR: Resistance

EMA: Resistance

Parabolic: Eliminated

Notes: Purple crossed White and Smooth up. DB / SAR down with BLUE DIVERGENCE attach at 0.0 FIBO. SAR attach above PSAR and 38.2 FIBO. Trend EMA arrow up. MACD zero cross arrow up. FIBO up.

Notes: Four Horsemen up. MACD zero cross arrow up. Trend EMA arrow up. MA crossover arrow up. FIBO up.

FINAL NOTES: H1 up. H2 down however turning up. Daily up. H2 SAR attach above PSAR and 38.2 FIBO. I expect the market to continue up, then SAR will turn DB. H1 and H2 will be in sync for the up after H2 EMA Purple cross with PSAR flip. I will enter long position after H2 EMA Purple cross on open candle at Purple, or retrace to Purple.

Adjustment: H2 EMA crossed Purple. Open candle at H1 EMA and 61.8 FIBO support, H2 EMA support, and Daily EMA support.

Long: Entered long position off H2 open candle at EMA support. Set TP +40 SL 40.

Result: Took + 40 from the market.

[illegible]

May 19, 2017 – pg 477

dove alliance :

Every day I go through all the postings. Listen to the traders and examining the trading plans. And trading for as long as I have; and knowing what I know, I sometimes forget at one time I was exactly where most of you are at now - knowing nothing about trading.

Most traders have absolutely no knowledge about support and resistance. Or even how to wrap their minds around the subject. I see entries on an H2 chart and I have to shake my head wondering why that trader is counter-trading a support on an uptrend; or counter-trading a resistance on a downtrend. Especially when it is showing all over the chart.

There is only one way to lose a trade with the Paradox: and that is counter-trading support or resistance. And I can assure you that trade is guaranteed on being a loser. You can never lose a trade if you trade the trend. And that is guaranteed also.

The major problem with traders is the inner fear of pulling the trigger. They lack faith and believing and without faith; then fear establishes itself in every emotion the body can consume and the trade is gone. But the most amazing thing about the Paradox is fear has no control on truth. The Paradox does not lie but only shows the truth. All one needs to do is gain faith in what the system is saying and act on it.

Like I have said many times over: The Paradox is about trend with support and resistance within the trend. If the trend is up; then it is all about trading off support. If the trend is down; it is all about trading off resistance. If the trend is up then support is showing in the chart. If the trend is down then resistance is showing in the chart. It is pretty simple if you think of it in that way.

The indicators on the Paradox are finely tuned like a Ferrari. The power they have amazes me even today. The Parabolic's has so much power it just knocks me over. And then the way EMA syncs with the Parabolic at the Purple's crossing. Purple, White, Smooth manifest themselves in a total support for an uptrend or resistance for a downtrend with the Parabolic flip; and EMA is already in the groove to run with the trend. There is absolutely nothing lagging; they are all spot on for the moment of entry.

That is only a very small part within the Power of the Paradox. The Fibo has so much power that is unbelievable. Watching how the 23.6 works as support in an uptrend; or resistance in a downtrend, along with Purple and Smooth.

Then there is DB and SAR. It is totally amazing in how they work together; especially in a ranging mode. And then the Fibi high and low holding support and resistance as it is ranging. The DB plays a crucial role in knowing the direction of trend when you are creating your trading plan. If the DB is attached on top then the trend is down. If the DB is attached on the bottom then the trend is up. That is very simple. If you are trading against the DB then you are counter-trading. And if ROMAR is going through center towards purple and heading for EMA, with the DB opposite of the ROMAR trend; then ROMAR will be breached with the DB trend. If the SAR appears on a bottom candle in a downtrend; then you wait until it reconnects onto the top of a retrace candle; then take entry back into the trend and vice-versa.

In order to conquer fear you must stop with everything and place your all in studying. What I am finding on your trading plans is going around the same mountain with the same mistakes. Last week I have uploaded a simulator for you to use. So use it and go back where your mistakes happened and find the answers into why. And I can tell you now the answer; your trades where against the trend. If you study that moment when you pulled the trigger, you will see how, and why you traded against the trend.

I suggest very strongly in learning and wrapping your mind around support and resistance of the Paradox. The market is always in trend; even in consolidation. And with every trend there is support going up and a resistance going down. And the Paradox shows it all as the market is moving.

[illegible]

shinny:

Here is my trade from today (EURJPY):

Here is the print:

[illegible]

May 23, 2017 – pg 479

shinny:

Hello Traders

Here is my trade from today (GBPUSD):

2hr Chart:

The Daily is in an uptrend, and my entry was around Daily Smooth. I missed the touch on the lower BB that went straight up for +40, so waited to get in at a similar price, which was at 2hr ROMAR.

The one issue with this trade was ROMAR as Support, and PSAR/Purple as Resistance and been very close. But the reasoning (in the rules) is that the market is in consolidation so trading is from the bottom up and top down. The Lower BB is close to ROMAR, and also the same level as Daily Smooth, so I was happy to be long.

Here is the Print:

[illegible]

shinny:

ok..What about psar was not that resistance?

- 1) ROMAR is support. Why? Because of EMA not **crossing** ROMAR.
- 2) EMA is Support. Why? Because Purple has not **crossed** it.
- 3) PSAR is Support but is **invalidated** because of **Consolidation**.

If Smooth/Purple don't cross within 3 candles of White/Purple you will have an EMA Slider. In this case Smooth/Purple did cross, but there was no chance of Purple/EMA crossing because the market hit ROMAR Support with DB/SAR and Regular Divergence.

I'd suggest reading about how each indicator works, because they are all, and this system is, all about Support/Resistance. Knowing how each indicator becomes Support/Resistance and how to use them are the keys to the mint.

[illegible]

May 25, 2017 - pg 482

shinny:

Hello Traders

Well, I feel slightly groggy today after last nights Manchester United cup win, but here are my trades from yesterday:

EURJPY 2hr:

I bought slightly too early at the close of the bar at Purple. SAR came in on the next bar. Daily is still in the uptrend so just keep attacking that trend north. What we had here was just a tight market, but no more than a Smooth slider, so we keep trading with the Daily.

Here is the print:

EURJPY Buy 25/05/2017 00:57:52.001 125.132 125.636 40.3

Here is the 2hr GBP chart:

The Print:

Scroll back, backtest and backtest and you will see the same things happening over and over. Look at the whole picture and how everything works together.

[illegible]

May 26, 2017 – pg 484

Hendo

My main motivation for pulling the trigger was because the lower BB was inside the FIBO. After Dana's last tutorial I was confident with my trade going beyond ROMAR, to hit my TP, target around the lower BB.

Notes: Four Horsemen up. DB / SAR with MAGENTA and GREEN DIVERGENCE attach at 0.0 FIBO. DB down with SAR price tag just below 23.6 FIBO and PSAR. SAR attach and still heading up near 0.0 FIBO. Trend EMA arrow up. MACD zero cross arrow down. FIBO down.

Notes: Purple crossed White and Smooth down. EMA holding support. DB / SAR with GREEN and MAGENTA DIVERGENCE attach at 0.0 FIBO. SAR attach below PSAR near 50.0 FIBO. Trend EMA arrow down. MACD zero cross arrow down. FIBO down. Lower BB inside FIBO.

Notes: Purple crossed White and Smooth up. EMA holding resistance. Trend EMA arrow down. MACD zero cross arrow down. MA cross over arrow down. FIBO down.

FINAL NOTES: H1 down. H2 Turning down. Daily up. Market is in consolidation. I will enter short position after H2 EMA crosses Purple.

Short: Enter short position on H2 open candle at Purple. Set TP +40 SL40.

[illegible]

May 26, 2017 – pg 484

I was asked how did I know we were going into an uptrend ranging mode? The answer is with the Daily Parabolic.

Taking a look at the picture below you will see the Beginning of the Uptrend Ranging. First is ROMAR as support; and secondly the Parabolic is support.

When the beginning began the DB/SAR were connected at the text Beginning of Ranging at the Top of the Fibs. There was no-way the market was going to turn on a dime for the simple reason the Parabolic was not in position to flip. Instead it went sideways for a few days and then the SAR connected for the up to reconnect with the DB which means higher high.

It got higher high and the SAR reconnected with the DB. The Problem is it will continue with higher highs because of the Parabolic trend. This will continue is a ranging mode until the Daily Parabolic flips. Nothing will change that.

The next candle went higher high but retraced more than 50% of its candle; which means the next candle will continue south for the Parabolic. It hit the Parabolic and both the DB/SAR connected at the Parabolic. What you have now is the DB telling you the next connection for the DB is on the topside; unless the Parabolic flips.

As you can see the SAR reconnected on the top with the Fibo and without the DB. Then connected on the bottom WITH THE PARABOLIC FLIP.

[illegible]

Jun 3, 2017 – pg 491

dove_alliance :

You are right with the White crossing going into consolidation. But Smooth is the signal indicator for a slider, along with EMA. One thing to focus on is with EMA crossing Purple in a slider. The Parabolic will not flip until EMA touches Purple for a crossing; it is then the Parabolic will flip. This is **ONLY** on the H2 chart. Smooth will always stay under White for an up slider and above White for a down slider.

There are times a slider can go many, many bars and can reverse the market. How you can visually see this is with Smooth and Purple. If you had just came out of an uptrend and into a consolidation and the market is then going sideways with the indicators compressing together. The Parabolic is also moving closer and closer towards EMA from the uptrend. Now you have a consolidation totally compress together. With this compression this is what you will be looking for.

For the slider:

If EMA is above Purple and the Parabolic still having the Power - which it will - then you will have a power candle that will get above EMA with Purple pointing up and all three: White, Smooth, and EMA will Recross Purple for the slider back into the Uptrend.

For the Reversal:

If EMA is below Purple with White and Smooth Above Purple and the Parabolic is still holding power for the up. What you will have is Smooth crossing White above Purple pushing Purple down for the EMA crossing and the Parabolic flip; and you are in a reversal.

These scenarios are on the H2 chart ONLY. Attempt these scenarios on the H1 and you will be burn.

Your stop is ALWAYS 40 and not 60. If you had made the right entry your 40 will never be hit.

There is not one scenario you can think of that the Paradox will do for you. All you need to do is study all scenarios and the Paradox will show you how it is done.

[illegible]

Jun 6, 2017 - pg 494

Hendo

Hello Traders,

I have been very busy with my highly active young household, as well as focusing on another trading pair to better fit my schedule. I really only post if I feel everyone can benefit in some way or, if it was an interesting set up that was not posted.

Since Dana said he didn't mind Shaun or myself to post on other pairs I thought this was an interesting scenario, after a major market spike. The plan, entry and result are pretty self explanatory.

The main reason for this post is to show the power of the Paradox, even with a different pair. For everyone who is still learning and posting please remember to only post on the the E J and to respect the rules Dana has laid out.

Hope this helps!

Here is my plan as well as entry on E A.

Session Sydney: EUR - AUD 6/8/2017

Daily

ROMAR: Support

EMA: Support

Parabolic: Resistance

H2

EMA: Resistance

Notes: Four Horsemen down. DB / SAR down with GOLD and BLUE DIVERGENCE attached at 0.0 FIBO. SAR attach above 38.2 FIBO. Trend EMA arrow down. MACD zero cross arrow down. FIBO up.

H1

EMA: Resistance

Notes: Four Horsemen down. Trend EMA arrow up. MACD zero cross arrow down. MA cross over arrow down. FIBO down. FIBO down.

Adjustments: Major market spike, zero spread for the short.

Short: Entered short position in the moment off H2 PSAR hit. Set TP +40 SL 40.

Result: Took +40 from the market.

[illegible]

Jun 14, 2017 - pg 498

Hendo

Hello Traders,

I have not traded the E J in a while however, this set up was too good to pass up. This candle moved down very quickly, I was ready for it and still missed my ideal entry by three pips!

Here is my plan with screen shots for review.

Session London: EUR - JPY 6/14/2017

Daily:

ROMASR: Support

EMA: Resistance

Parabolic: Resistance

Notes: Four Horsemen Down. SAR attach with GOLD DIVERGENCE below 61.8 FIBO. MACD zero cross arrow down. Trend EMA arrow down. FIBO down.

H2

ROMAR: Resistance

EMA: Resistance

Parabolic: Resistance

Notes: Four Horsemen down. DB down with BLUE DIVERGENCE attached piercing BB at 0.0 FIBO. Trend EMA arrow down. MACD zero cross arrow down. FIBO up.

H1

ROMAR: Resistance

EMA: Resistance

Parabolic: Eliminated

Notes: Purple crossed White up. EMA holding resistance. Trend EMA arrow down. MACD zero cross arrow down. FIBO up.

FINAL NOTES: H1, H2, Daily in sync with down trend. I will enter short position off H2 resistance. H2, and Daily BB opening up for the down. I expect market to continue down. Daily SAR should reattach to new candle or turn DB, with room for +40 before hit on ROMAR.

Adjustment: H2 open candle at Purple resistance and 23.6 FIBO. Daily retraced to Purple resistance near 61.8 FIBO.

Short: Entered short position on H2 open candle at Purple resistance. Set TP +40 SL 40.

Result: Took +40 from the market.
