

Oct 25, 2017 - pg 582

dove alliance :

Let me give you Traders what helps me to be a successful trader. The rule is 40/40 which means 40 plus your spread for a TP target. The target is either resistance for the long (high) or support for the short (low). I never look both ways but only the direction the Paradox is telling me. When I pull the trigger there has to be 50 pips to my target. This will eliminate the risk of coming short of my 40 TP. In other words - if I go short there is no support accept the low and if I go long there is no resistance accept the high. This means I have a clean shot of a 40 TP. In consolidation you eliminate the Parabolic as a stopper. Once the Parabolic flips you have a clean shot of 40 TP.

Example: In this scenario we are in now; you have the Parabolic holding support. If a bar opens below the Parabolic then you are below EMA and the Parabolic which places the LR in position to take out the Parabolic. For those who haven't study the LR is hidden and is used in flipping the Parabolic. If that does not happen then I wait on the flip and I am in the ride for 40. If neither happens then you are in an EMA slider for the up.

Before you pulled the trigger wait on the Parabolic or the slider. Never anticipate but wait on the "Moment". Patience is the greatest reward you can receive.

[illegible]

Oct 25, 2017 - pg 582

dove alliance :

Well Traders - I gave you the scenario last night and it played out exactly as I gave it. The 03:00 release took it up just under the high resistance of the Fibo for less then the TP. The 04:00 releases hit the High for a double top and drop it down below Purple with the Parabolic. Next release at 07:45 the Parabolic flip with more then 50 pips to support. As I have always said - it is all about support and resistance. If you stay focus from moment to moment you will see the right trade.

What I wanted to prove to you traders is how to use the release to your advantage. The Paradox will show you the way in using support and resistance with the releases. You just need to use patience and wait on the right bar for the entry. If you know it not you can set up alarms on your platform with the Highs and Lows of the H2 Fibo and the 23.6 - 61.8 of the Daily Fibo. The variables with the Paradox is limitless and all you need to do is take advantage of many as you can.

You traders that went short had the High to your advantage which had saved you and you got your TP.

[illegible]

Oct 27, 2017 - pg 585

shinny:

On the 2hr the market hit the BB, and what is the rule when the market hits the BB, especially on a downtrend? The market will move sideways (at some point) and you will get an entry at White. I always wait until the market gets to Smooth, which is usually just about the same level as a White entry by the time the market has moved sideways some more.

So knowing that rule would not only stop you doing something silly (like going long) but would also have you alert and picking your spot for the short. It can be difficult getting on a move down, but this scenario is probably the easiest one of all.

+++++

dove alliance :

Thank you Shaun for pointing out the entry and you are very right.

Now let's talk about what else they all missed which is the ROMAR sync.. H1 ROMAR crossed EMA before the Double Bottom, H2 at Purple heading for EMA at the Double Bottom; before everyone's entry going long the H2 ROMAR had crossed EMA. AT entry the H4 at Purple and is now at EMA for the crossing. That target is the Daily ROMAR. The trend is down and everyone goes long.

What amazes me is when the first trader goes long or short everyone else follow that first trader's entry. I wonder why. Maybe now you traders will try to find your own trade and not follow everyone else. The rules are being broken left and right for the entries and that is the major reason for losing. The H1, the H2, and the H4 are all in the downtrend; and not one of you that pulled the trigger going long had seen the actual trend.

[illegible]

Oct 31, 2017 - pg 588

shinny:

Hello Traders

Here is my entry for today:

I went long from Daily Support - ROMAR. We had multiple touches, a double bottom or even an inverted head and shoulders, whatever you want to say, but the main thing is we were coming off Daily ROMAR.

For those that went short 25 pips above Daily ROMAR, just think about this for one minute: What is the Paradox System all about? It is 100% about Support and Resistance. What is a major S/R level? ROMAR. Why oh why do you want to sell right on top of Support? Please, please, please don't make it hard for yourselves.

Yesterday the short was a no brainer trade. Look at the EMA/MACD arrow, not in the correct order. The market is going back down again. The MACD stayed Above zero on the fresh low, there is 12+ hour heads up to be ready for a long trade, coming from Daily Support.

On your plans you mention Daily ROMAR, but I don't think anybody really mentioned or appreciated that that was important. That fact was on my mind from the Sunday open, that we are close to ROMAR, what do I need to be paying attention too?

The short yesterday you had 65 pips to support, today there was 25 pips, and that would have taken you right down to the 2hr PSAR flipping for the up!

Write your plans without bias, and just put what you see! For that there is no thinking required. The only time you need to think is applying what you can see to what you know, or what is in this forum and what Dana has taught you.

I have said this a lot of times in the past, but when you are buying when you should be selling and selling when you should be buying, you are actually not that far away from being correct. You just need to engage the thing in your head that God gave you to keep you from doing daft things like selling on top of ROMAR!!!!

+++++

Hendo

Hello Traders,

Very powerful post by Shaun, and TraderMarcos. Here is my plan with entry, again offering a slightly different perspective, providing for the same result!

Best Regards,

Chad

Session Sydney: EUR-JPY 10/30/2017

Daily: Opened 4 pips above ROMAR.

ROMAR: Support

EMA: Resistance

Parabolic: Resistance

Notes: EMA crossed Purple, White down. DB down with Blue Divergence attach at 0.0 FIBO. Trend EMA arrow down. MACD zero cross arrow down. FIBO up.

H2

ROMAR: Resistance

EMA: Resistance

Parabolic: Resistance

Notes: Horsemen down. DB / SAR down with Blue and Gold Divergence attach at 0.0 FIBO. Trend EMA arrow down. MACD zero cross arrow up. FIBO up.

H1

ROMAR: Resistance

EMA: Resistance

Parabolic: Eliminated

Notes: Purple in slider with White, and Smooth. EMA holding resistance.

Final Notes: I expect market to go into consolidation before BOJ high impact rate release. H1, H2, and Daily in sync with down trend. Market is in a consolidated down trend. Daily, FIBO flipped for the up, and ROMAR is holding support, and out of balance with Purple. I expect the market to go long based on Daily ROMAR support, and will rebalance with Purple, and target for the market going long. I will enter long position off support.

Adjustments:

Long: Entered long position on new Daily open candle retrace to ROMAR. Set TP +40 SL40.

Result: Took +40 from the market.

Nov 1, 2017 – pg 589

shinny:

Hello Traders

Here is my trade for today.

It is the EURUSD.

Here is the Daily:

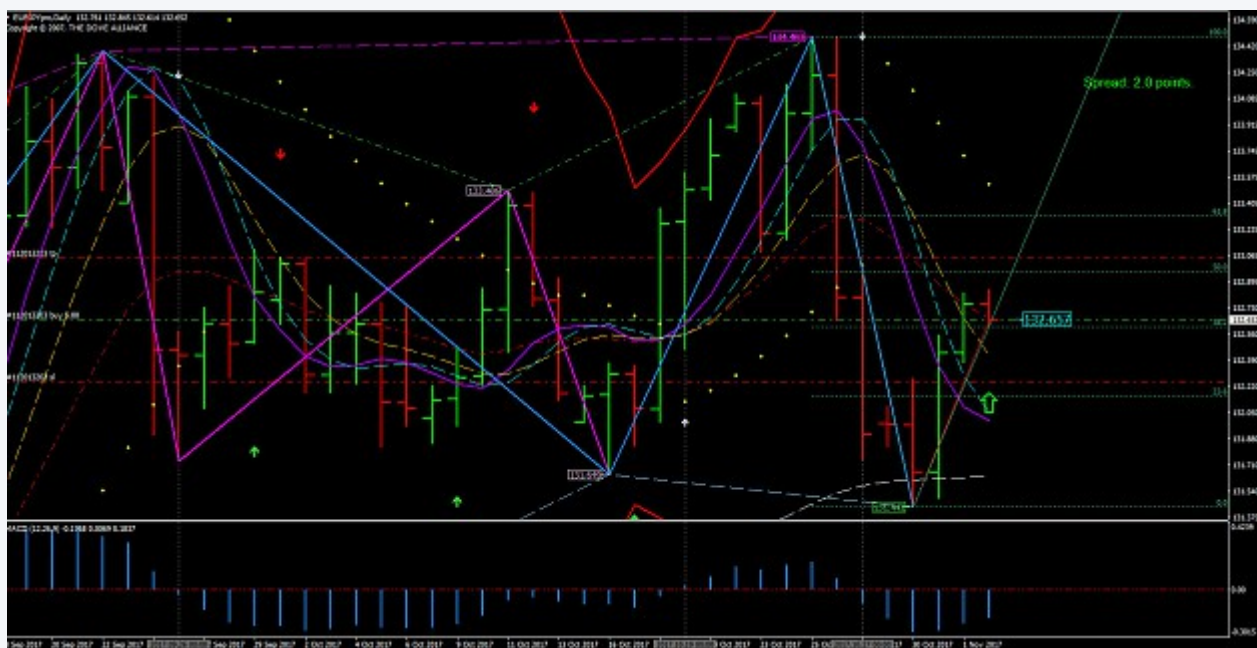

You can see that the market is down with ROMAR, EMA and PSAR as Resistance. Market dropped and tagged the lower BB. Market didn't touch every BB so I was looking for the market to move sideways to White/Smooth, which is what happened.

Here is the 2hr chart:

Adjustments: H2, DB / SAR attach at 0.0 FIBO. Daily, Trend EMA arrow up.

Result: Took +40 from the market.

## Quoting SixSigma

Just one question with this trading plan. On the daily, the EMA was resistance at least from my understanding (above purple from prior cross). You wrote daily EMA was "support/resistance" then entered the trade "going long off support"- was this a missight, or are you anticipating what is happening? Just trying to understand. Also, same with H2 romer: you mentioned it was support even though it hadn't crossed EMA yet- was still resistance. Your trade went almost straight up, with romer subsequently crossing EMA- very impressive. Kind of like you're trading with your heart and not overanalyzing the moment. I just want to make sure I'm not missing something. Sorry for the question, hope this isn't coming across the wrong way.

Hello Dom,

Great questions! There was no miss sight, with regards to my plan. It is exactly as stated a (Plan). With the market above Daily EMA and, for the purposes of determining trend and entry, starting with the H2 chart, then referencing the H1, as well as H4.

I one determined the current trend was up, according to the H1, H2, and H4 charts. So I was thinking only about going long. When I state Resistance / Support, it is exactly that. The Daily EMA was resistance. With the market opening above EMA, for the purpose of entry it would act as support, knowing full well it could go a little beyond as it did. H2 ROMAR was resistance with EMA below. But, again for the purpose of entry it was acting as support. It wasn't until ROMAR crossed EMA that it would become support.

H1 horsemen were very solidly up. H2, Purple, was sliding over ROMAR. Purple, was in a slider with Smooth and was my target for entry. With another 10 pips to PSAR it was a very comfortable entry with room for more retrace down. H4 Purple was a comfortable distance from Smooth with ROMAR in between. This was the final determining factor for me going long. As I figured Purple would slide over ROMAR and Smooth.

I will on occasion list the main trend indicators as both support / resistance as dictated by the market, to remind myself that the market is fluid. While also knowing full well it will move through important support and resistance levels, and eventually finding those levels with the help of the ever important confluence factor. As stated, my entry was with the H2 Purple / Smooth, and Daily 38.2 FIBO confluence.

The market never went more than 6 pips below my point of entry. For myself and the way I need to trade as a professional the entry is crucial (Please don't ask me to elaborate on that). Most of my entries are after a retrace, as I want to enter as low or high as possible. I set SL40, however I'm looking to stay within a 20 pip range of the trade going against me. With that said, a perfect entry for me is being within a range of less than single digit pips going against my entry.

I know that may be quite a lot to absorb while you're still learning. They were great questions and I wanted to show the kind of thought that goes into a plan. As you can see that is a lot of information, the trick is to keep it simple, and not over think it as the Paradox is showing you the way. That is why the (moment) is so important. Almost always, the market is going against your entry. It's going short when you want to go long. That is the moment of hesitation for most, and the moment of pulling the trigger with conviction and confidence for me! Believe me, It was much harder addressing your questions than it was to prepare my final notes for this trade!

[illegible]

Nov 7, 2017 – pg 594

### dove\_alliance :

I have always learned the greatest defeat in trading is NOT knowing where support and resistance is before a trade. And in between support/resistance - resistance/support is the trend. You can be in swings from support to resistance and vice-versa and still - there is a trend between those two elements.. The Paradox gives you those signals with either the DB, or the SAR, or both. Then you have the divergences to verify it for you. Pretty simple once you see the scenarios.

Instead of trying to out think the Paradox and let the Paradox do the thinking for you; a revaluation will come into existence. When I first started trading the Paradox it all came together when I finally broke all my bad habits and focused on support and resistance. It was then I was able to read what the Paradox was saying to me. The market is totally about support to resistance - resistance to support. It may be higher high, or lower low, or anything in between for a high or a low. And the TREND ALWAYS begin with a new high or a new low. All you need to do is recognize these highs and lows and take advantage of the profits that follow..

+++++

### shinny:

Hello Traders

Here is my trade for today:

Market is in some pretty heavy consolidation for the last month around Daily ROMAR, and the market is still recovering from the 250+ pip drop last week. When I did my plan I saw the Resistance on the Daily (ROMAR/EMA/23.6) and decided I was going to be looking at a short.

I looked at the 2hr and saw that ROMAR and EMA were basically on top of each other, so I would wait for a close underneath them as I didn't have enough room to trade down to them. If I had been around earlier, its possible I would have used the 1hr to enter literally right at the top, but I wasn't around to do that.

What I also saw was the DB/SAR running separately, so I knew that there was going to be a deep move south to bring out first the SAR then the DB, which happened and I got my 40 right at that point.

Symbol	Opening Direction	Closing Time (UTC+0)	Entry Price	Closing Price	Pips

Quoting senna68

Hi Shinny, Have you not waited for the Psar to flip before taking the trade ? Also, you trading the GBP/USD....Just reading and reading mate so if i`m incorrect please forgive, trying to take it all in and you seem to be a person who has grasped this method of trading so i examine your posts

Hello mate

The GBP market is in consolidation, and what you will quite often find in Consolidation is that the PSAR will flip the **opposite** way to the way you are looking to trade. So I was looking for the short trade at Resistance with the DB/SAR, and the PSAR flipped for the Up on my entry bar. Yesterdays trade was also the same with the PSAR.

I started trading the USDJPY then EURJPY as per the forum, but Dana lets me post the GBP which I trade almost exclusively as it gives a different slant to EURJPY.

+++++

Shaun and myself have been here going on 2 years teaching the Paradox. I don't know about Shaun; but for me, I am very tired of going over, and over, and over the same scenarios in how to trade, and then seeing the same mistakes over, and over, and over again. If you can't get out of your garbage pit, and learn, then maybe you should find something else to do.

[illegible]

I just wanted to post my results for last week, I did an extra trade so 6 instead of 5 and each was a winner. I was mainly (5/6) short with the Daily ROMAR/PSAR each day, but there were also opportunities for long trades, only 1 of which I took.

[illegible]

Here is the Daily chart which shows you how tight the market has been for me this week, but where this market would kill most other traders, by trading the Paradox I was able to exploit opportunities every day to make money.

Symbol	Opening Direction	Closing Time (UTC+0)	Entry Price	Closing Price	Pips
GBPUSD	Sell	07/11/2017 15:20:33.795	1.31502	1.31099	40.3
GBPUSD	Sell	08/11/2017 10:24:20.606	1.31636	1.31220	41.6
GBPUSD	Sell	08/11/2017 12:13:43.156	1.31413	1.31009	40.4
GBPUSD	Sell	08/11/2017 09:14:43.137	1.31442	1.31038	40.4
GBPUSD	Sell	09/11/2017 10:00:03.397	1.31337	1.30934	40.3
GBPUSD	Buy	10/11/2017 12:13:48.552	1.31503	1.31903	40.0

Nov 13, 2017 – pg 602

shinny:

Hello Traders

Here is my +40 for the day.

Daily Chart:

Daily chart showing ROMAR & EMA as Resistance, with market still in a 136 pip range (apart from the break out on Friday). The market is in Consolidation Ranging.

Here is 4 Hour Chart:

And here is the screen print:

So I basically traded the 4hr chart with this trade - in Consolidation like this I will trade the big 4hr swings with the DB/SAR, with the 2hr for timing. But in between those 4hr DB/SAR swings, I will trade the 2hr DB/SAR swings.

[illegible]

dove alliance :

Higher high than the previous high  
Lower low than the previous low  
Double top  
Double bottom

In the beginning when I had talked about divergence I had also recommended for those in wanting to learn divergence to use Williams' Percent Range Oscillator. This oscillator works very well with the Paradox. I can write a whole chapter on divergence; but teaching divergence takes time and lots of patience with experience traders that has been working with highs and lows. So the divergence with the Paradox is basically for experience traders.

[illegible]

Nov 17, 2017 – pg 609

dove\_alliance :

Traders - there are 4 of us that trades in the **"moment"**. Shaun, Chad, Niki, and myself. There is also a couple other traders that have been doing very well trading in the moment. And none of us would have never learned how to trade in the moment if it was not for the Paradox. You have seen some amazing trades from these traders because they had placed their hearts into learning and had become one of the elite.

We cannot teach you how to trade in the moment because of the baggage being lugged around. Most of you haven't even learn the rules and wondering why you cannot move forward with what you are learning, or get lucky every once in awhile. In other words - we can only do so much for you; and the rest lies upon each of you. We can teach you all we know but if you are looking for short-cuts, or other avenues of learning then it is all on you. We can guide you on the right path but if you want to take another route at the crossroads then that too is on you.

The learning process is totally upon you. That is how you gain the skills of being a trader. Trading is a career and not a hobby. Being a trader comes from the heart of an education of learning. And there is nothing we can do for you if you do not have the heart of learning.

[illegible]

Nov 21, 2017 – pg 612

dove alliance :

OK traders - I am on lunch break and I will make this post to show you in how to use the H1:

Trading Plan 17:00 EST.

**H1 Notes:** The H1 Fibo is down with the Parabolic moving towards EMA for the flip. EMA in a slider as support with ROMAR as resistance. The 23.6 holding resistance with the market below the 23.6.

**H2 Notes:** The H2 Fibo is up with White at the crossing of Purple. EMA in a slider as support. The Parabolic is support with ROMAR as resistance. The 50% of the H2 is holding resistance going side ways.

**H4 Notes:** The H4 Fibo is up and the 38.2 holding resistance. ROMAR as resistance and EMA in a slider as resistance with the Parabolic as resistance just above EMA.

**Daily notes:** The Daily with the new opening showing EMA crossed purple for resistance with ROMAR holding support.

This is exactly what should be showing on your trading plan. All you want to know is where support and resistance is located on all your charts. And with this scenario you are in a very heavy consolidation.

**Final notes** should look something like this within this scenario:

The H1 has the power for the down with ROMAR and the Parabolic as resistance with no support. H2 Fibo is also holding resistance at the 50% with the Parabolic support being eliminated for power. The H4 EMA as resistance in a slider with the Parabolic as resistance. The Daily EMA is now resistance. The H1 23.6% Fibo; The H2 50%; and the H4 38.2% Fibo are all in confluence for the short off resistance.

**Entry:** Short off confluence.

Traders - this is how you create a trading plan. As I have said many, many times. Your trading plan has everything to do with support and resistance.

+++++

The E/J is exceptional due to the fact the E/J responses to the Paradox in all scenarios; which many other pairs does not create many of the scenarios the E/J does. With this fact the Paradox opens the door with the E/J in trading all the scenarios that is being repetitious as past history.

What many of you are missing is the flip of the Fibo. The Fibo is the designated creator for all highs and lows. It is automatic and will create a right Fibo provided your charts are exactly and correctly drawn with the right spread on all your charts. If you are wondering what I am talking about means you have not read this thread.

Right now the H2 has a resistance of 0.0% with a support of 23.6% with less than 40 pips between this two levels. I suggest you traders have not taken the time to study the Fibonacci Retracement then do so now. If you do - then your trading skills will advanced dramatically.

dove alliance :

## ONE STEP AT A TIME

An edge is everything about the way you trade that can help put the odds in your favor. It's a combination of time frames you trade, key levels you've identified, your risk to reward ratio, etc. It even goes as far as your pre and post trade routine. How do you handle losses? What do you do when you win? These are all things that make up your trading edge.

The Paradox is a combination of endless scenarios as an edge of being profitable; and you don't have to master all of them at once. Nor do you have to master all of them to start putting the odds in your favor. It's perfectly natural to master one set of factors and then slowly expand to others to further define your edge. Not only is this natural, it's the preferred way to learn.

Have a mindset of becoming a master of one or two factors. You'll find this to be the fast track to becoming profitable, and much less stressful. Once you've mastered those one or two things, expand to others to continue stacking the odds in your favor. This way you learn the rules in a steady and fortitude expression of gaining knowledge with each scenario you are learning.

For example, master identifying key levels of support and resistance with opening price of the 17:00 ET bar. Resistance and support would be the previous day high and low to begin with. If opening is at low and you see the trend is up then pull the trigger going long; and vice-versa going short. This is really all you need to start seeing your profit curve rise. Then once you're comfortable with those two, strengthen your trading edge by learning different entry and exit strategies.

This means that it does not matter if the trade wins or loses, because if you trade with a strategy based on an edge, then your trading will produce winning trades over time that will make up for the losses. Of course this is not the whole picture, because you must take into account risk to reward and money management. However, when you have an edge, you have a starting point in which you can then begin to build from an edge.

Professional traders can write down their trading plan and articulate it without deviation. The reason for this is that an “edge” only works if it is applied consistently.

Emotions are the nemesis of consistent application of an edge which is why you will often hear of the importance of controlling your emotions. Inversely, rules are the best friend of any "edge" as it allows for consistent application and repetition.

What do you do immediately following a loss? I believe I can speak for most traders. You would immediately start going through all your charts looking for a new setup.

If you're doing this it means your emotions are getting the best of you. After a loss it's far too easy to feel as though you need to win your money back.

Instead of seeing a loss as a reason to hop back in the market, take it as a signal to look at what you could have done differently. Remember, it's just feedback.

So why is the failure rate so high for traders?

Simply put, most traders haven't yet learned how to lose. Our emotions will always try to outweigh our logic after a loss; it's human nature. The key to becoming successful isn't about eliminating emotions after a loss, it's about channeling them in a way that will make you a better trader by walking away until you have control of your emotions.

Although it's simple, you'll likely find walking away after a trade to be one of the hardest changes you've had to make to the way you trade. But trust me when I tell you that it can have a drastic effect on your consistency and put you one step closer in becoming a successful trader. Waling away is also an edge of being a great trader.

Let me be very clear about having an edge. Without an "edge" you will never make it in the market. It is a process of taking one step at a time in taking an edge and build one after another. The Paradox is limitless in what it can produce when it comes to the edge of success for any trader. Don't think for one moment you can bring your baggage and garbage of the past and be successful with the Paradox. You have to leave behind all you have learn from the past and start over with the Paradox.

The Paradox is one unite consisted with any and all variables in trading. There is not one variable you can think of is not built into this system. Every scenario within the Paradox is an "edge" for success. All the successful traders with the Paradox are those who have capture at least one edge and are consistently profitable with that "edge".

I am the benchmark of this system and to be very honest; I do not know everything about the Paradox and never will. But I am very successful with the Paradox because I have harness the edges that has fit my strategy as a trader. This is what makes the Paradox so overwhelming when it comes to the variables; there are too many to conquer them all.

The "edge" are in the scenarios. Each scenario is an edge with its own rules. You apply the "rules" you also apply the "edge". This is why it is a minimum of 6 months of learning. You take one scenario at a time and learn that scenario until you have the edge. And then you move on to the next scenario.

To be successful it is all about: ONE STEP AT A TIME.

Oct 12, 2018 – pg 722

dove\_alliance :

Throughout this whole thread is filled with information of becoming one of the world's greatest trader. Provided you have the right heart to study and spend more than 6 months in learning. This also means you have to waddle out of your garbage pit and relearn how to trade. And what is the odds of you being one the 5% in succeeding and becoming one of the elite when you have to spend so much time in learning? The odds are not good if you do not have the right heart

We are going on three years when this thread was opened. And I had spent 2 of those years in teaching how to trade. The information is composed of being a great trader with a system is beyond the imagination of being great.

The Paradox is set up in taking 40 pips on every trading day without any doubt. But there is three words that must always be part of your trading strategy on pulling the trigger: "In The Moment". This means the market must come to you and not chasing the market.

I see so many mistakes on creating a trading plan. For one thing the plan is created on the beginning of the session you are trading and on the beginning of the H2 chart BAR. In other words if the session begins 17:00 EST and the H2 is still running for another hour – then you wait until the next H2 Bar to create your plan.

Creating a trading plan is looking into the future and not the past. The past is giving you the information of what is too happen in the future. Such as - the DB and SAR – they feed you the information of where support and resistance is located; and where the next support/resistance will be located in the moment.

Although it's simple, you'll likely find walking away after a trade to be one of the hardest changes you've had to make to the way you trade. But trust me when I tell you that it can have a drastic effect on your consistency and put you one step closer in becoming a successful trader. Waling away is also an edge of being a great trader.

We are going on three years when this thread was opened. And I had spent 2 of those years in teaching how to trade. The information is composed of being a great trader with a system is beyond the imagination of being great.

I see so many mistakes on creating a trading plan. For one thing the plan is created on the beginning of the session you are trading and on the beginning of the H2 chart BAR. In other words if the session begins 17:00 EST and the H2 is still running for another hour – then you wait until the next H2 Bar to create your plan.

Creating a trading plan is looking into the future and not the past. The past is giving you the information of what is too happen in the future. Such as - the DB and SAR – they feed you the information of where support and resistance is located; and where the next support/resistance will be located in the moment.

In consolidation resistance/support will hold until the 4 horsemen had made their turn. The variables are limitless and you cannot use one variable against another – or else you will lose your trade. You cannot trade against support or resistance; or again – you will lose your trade.

Let me demonstrate with this screen shot of what I am talking about in using the DB and SAR. A major problem is knowing the rules for each scenario and the application of the variable for each scenario. Knowing the rules is one thing but applying the rules in the moment is another matter.

The only time the DB and SAR are not lock in stone is in trend. In trend they both will move from bar to bar until they hit their destination. In consolidation they both will LOCK IN STONE. Both the DB and SAR are your support and resistance while in consolidation. And this chart below is showing this very clearly while the market is in consolidation.

On the left of the chart you have the start of ranging with the SAR connecting and moved 60 pips. Every connection with the SAR is always with the connection of the Parabolic breaking loose from the **trend**. Always remember that. This happens **ONLY IN TREND**.

Next connection is from the top of the SAR resistance to the bottom. It moved 80 pips and the DB connected with the SAR. This connection with the DB/SAR is letting you know you are now ranging for the upside for a minimum of 100 pips.

Both the DB/SAR reconnected on the top with 100+ pips. A second entry (if you missed the original entry) with the 4 horsemen showing the continuance of the up movement with the Parabolic flip. Both DB/SAR connected for a down movement.

Next connection is heading for the bottom; and take note of something I had missed for a second entry. You have a Red arrow for the short and on the next open bar you had the open candle with White/Smooth crossing at Purple for a heavy entry for 40. The bottom of this move was 120+ pips with both the DB/SAR connection,

With this connection it is heading north once again with two extra entries. One off Smooth and the second off EMA for 40 on both entries and travel 100 pips; with both the DB/SAR connection on top.

The next entry was on the next bar going short because of support was +40 pips with Divergence connected.

NOW – let's talk about the divergence. From the last high to the current high you have the Green Hidden Divergence behind the Magenta divergence. This means the last current high is not completed in which it will go higher/high to bring out the hidden Green divergence.

And here is the hidden divergence to give up the extra pips of 100+. It will keep bumping higher/high for resistance for a possible double top with the Fibo getting above ROMAR and then back below ROMAR

And here is the final product with the DB/SAR hitting top from the bottom

he market had hit the 100% of the Fibo and reverse. Once the DB/SAR are set in stone then the 4 horsemen had to shift for the reversal and will do so in time with each bar turning for the down. I will repeat as I have many, many times. Trade from the Top (Resistance) to the Bottom (Support) and vice-versa. Never, ever from center. With every ranging scenario you have two entries for each flip of the ranging; and you can recognize the second entry in using the Fibo. This means your charts has to be correct in using the Fibo. Also take note this scenario is used on the H2 chart ONLY.

This scenario is more common then the others because it was a 3 day G20 meeting. Any world wide meetings of two days or more will produce this kind of scenario. And how do you recognize this scenario. The answer is with divergence being applied on both support and resistance in a ranging mode with the Hidden Divergence playing a critical role for all entries.

I have my crew together and we are heading for the Florida Panhandle to help rebuild the devastation left behind with Hurricane Michael.

dove alliance :

A - Be vigilant of ALL charts. See everything in the moment as a whole unit.  
B - Always trade from the top with resistance or from bottom with support. Never from center.  
C - Always trade in the moment and never pull the trigger until you are sure and not thinking.

"a) - Be vigilant of all charts. See everything in the moment as a whole unit."

There are only 4 elements you are interested in for the moment: EMA, the Parabolic, DB, and the SAR. Those 4 indicators are your trend indicators in conjunction with ROMAR; as for trend direction and/or consolidation. These four elements are also your support and resistance **for all entries.**

In other words – if you are not in **sync** with all 4 charts with your trading plan then you are not in the moment with the Paradox as a whole unit.

*"b) - Always trade from the top with resistance or from bottom with support. Never from center."*

90% of the time, with the new data at 17:00 ET, you are at the high or low of the previous day market. It is also the Central Pivot for the Daily. I bet most of you – if not all of you realize this. The other 10% is when the market is in a full blown trend. Once you have all 4 charts together in

a trading plan you will also have the top (resistance) and bottom (support) of the market. And if you are looking to trade from center of the high and low – then you are a loser. And most of you do that – you wait for the market move to center before pulling the trigger; and most times it is in the wrong direction.

"c) - Always trade in the moment and never pull the trigger until you are **sure** and not thinking."

Until a trader is at the level of recognizing support and resistance you always make your entry with a new bar. Your trading chart is the H2 which means your entry is on a new H2 bar. That is a rule and I do not want to see it broken again. Your goal in becoming an Elite trader is learning how to trade support and resistance; which means in the moment. And you need all 4 charts to become one of the Elite.

Your goal is 40 pips daily and with the Paradox 40 daily Pips are on each of the charts. Like I have said – all 4 charts are in sync with one another. All you need to do is place the 4 charts support and resistance on your trading plans and you will see the sync. Do not ever think you have it right until you are **sure** you have it right before pulling the trigger.

To become an Elite trader is “knowing” and not thinking. Knowing everything about your trading plan is without fault but perfect for the upcoming trade. And being a perfectionist is about seeing the whole picture and not part of the picture within all charts.

When you THINK you know the rules is when you will become a loser. Knowing the rules within your heart is the only level of being successful. When you try to create your own rules is when you will be a loser. The rules with the Paradox ARE SET IN STONE and **thinking** will only turn your journey into a miserable reality.

Romar's trade above is showing exactly what I am talking about. He pulled the trigger thinking he had it all together; calling a RULE not being a rule and "thinking" he master a perfect entry, but only pulled the trigger in not seeing the whole picture. He went short with the H2 having the 23.6 Fibo as support, EMA, as support, the Parabolic as support. And then the H1 having ROMAR as support, And then having EMA on the H4 as support. That was a very bad entry because he was "thinking" with a batch of egoness in breaking the rules from left to right.

His trade had only 40 pips between resistance and support. With roughly 20 pips of entry to support. Which means he pulled the trigger from center. Only time will tell what will happen with his trade. And with multiple supports he may lose this trade if the H2 ROMAR crosses EMA.

dove alliance :

I want to take a few moments and explain the greatest reason why traders bankrupt their trading accounts. And it has to do with the mathematics of trades being lost.

Let's begin with ONE losing trade:

The question is – what will it take to make up that lost trade? The answer is it will take 2 **consecutive** winning trades to make up the lost and then the profit. The magic word is “consecutive”. In other words – you have a lost and your next 2 trades has to be winners to make up the one for the lost and the other for the profit.

You have a 40/40 TP-SL and if you add 20 more pips to your SL, because your trade is in the losing column, then greater is the risk because now you have 60 pips to make up if the trade becomes a lost.

Now – lets look at the mathematics:

If you risk your trading account (for any reason) then you can be sure you will become a loser.

Nov 15, 2018 - pg 733

I thought I would take a few moments and show all the entries that are not being posted. So lets take a trading plan for each of the entries:

You had the DB/SAR attached with the Standard Divergence that open above ROMAR. What is that telling you? It is telling you the Hidden divergence is behind the Standard with ROMAR as resistance and the SAR is also attached for a retrace (pullback) to the Parabolic. What is the reason? The reason is to expose the Hidden divergence by getting above the DB/SAR, and the Standard Divergence. And the Paradox did exactly as it said it would. It retraced to the Parabolic with the SAR for an entry going long.

You have The DB/SAR, and both Divergence for an entry going short. This is confluence.

You have an open bar above ROMAR Resistance with the Parabolic hit for an entry going short.

You have a bar connecting with the Standard and Hidden Divergence below the Parabolic. That means you need a retrace (pullback) from Resistance to expose the Hidden divergence. And because the SAR is on top means you must wait on the Parabolic resistance hit for an entry; in which your third entry happened.

Don't you wish you had my knowledge and wisdom. Well traders - you can have what I know. All you need to do is study every single little thing about the paradox as I had done.
