dove_alliance :

The Paradox

Looking into the Paradox I will expand the variables. The variables are what makes the Paradox work so well.

I'm sure you have noticed TWO swing indicators which are variables. One is named Paradox_SAR_ Swing (and we call it "SAR") and the other is named Paradox_SwingHighLow (and we call this one "DB") with Divergence.

DB is calculated between 5 to 7 trading days on 120, and the SAR is the actual swing with labels on the 120. The H4 and Daily are long term and used as reference.

One thing you have to always remember and that is the 120 is both the beginning (Alpha) and the ending (Omega). In short term it means everything begins on the 120 and everything ends on the 120. So all your trade entries begin with the 120 and your exits are with the 120. I know in time your trades will expand from the 40 a day to possibly 100 a day. And believe me; God will take you into that stage when He is ready.

The average range of the DB from connection to connection is roughly 400+ pips a week; and that my friends are not in a straight line. Which means the DB is swinging from higher/highs to lower/lows and vice-versa. That also means you are looking just over 15% of those 400 pips per day on profit.

These variables are very important because at each connection you should know where the next level will place itself. If the DB is connected from the bottom then you know the next connection is at the top, and vice-versa. All you need to do is be prepared for entry with the DB connection; especially when the market is ranging.

In this scenario you always know where the DB is set at. If it is High then the next level will be at the Low. But again – through this process you will continue having lower/low and higher/high with the Ranging Swings. With this insight helps you to set up on how you want to trade.

The Labels with the SAR consist of the higher/highs, lower/lows, higher/low, lower/high, double top, and double bottom. And with these Labels you also have patterns which are consistent with these elements.

If ROMAR is up on the 120 it will continue to create Higher/Highs and if ROMAR is down on the 120 it will continue to create Lower/Lows with each swing. On the lower/high and higher/low the market is consolidating and the SAR Labels are great entry points in swings.

Lets Look At The 3 Elements;

Becoming a successful trader can be achieved; provided 3 elements are conquered before you can even think of becoming successful.

Attitude:

Attitude is on top of the list. So what is attitude when it comes to trading?

a: the way you think and feel about someone or something
b: a feeling or way of thinking that affects a person's behavior
c: a mental position with regard to a fact or state
d: a feeling or emotion toward a fact or state
e: a negative or hostile state of mind
f: a cool, cocky, defiant, or arrogant manner in way of thinking

These definitions are all negative when it comes to trading – in fact – with anything in life. It is the very foundation of egotism. It is the attitude that takes control of your thinking and how you think. It is one's thinking that takes them on an illusion of falsehood instead of facts.

A positive attitude is making changes from egotism to humility. It is a change in the way you think.

When it comes to trading; one's thinking controls the outcome of a trade with other factors in which I will touch on with the 2nd and 3rd elements. When a trader thinks with biases, with frustrations, with analytical mind, and with lack of understanding, is on a path of uncontrolled emotions and fears.

Emotions:

a: obsolete
b: disturbance
c: a variation from the average or normal conditions

These definitions are also negative for a trader. They control an illusion of what your mind is thinking. The emotional effect of what is real and what is not. An emotion takes away everything as being a trader. Emotions takes away the most critical venue of being a trader – and that is focus. When you are emotional you have no insight, no flux of consciousness, and no foundation to see beyond the moment.

Fear:

False Evidence Appearing Real.

Fear is the most destructive element for a trader. It takes away the quality of being a trader. Fear of losing money, fear of making a decision, fear of changes, fear of making a trade with constant hesitations, and the list goes on. Fear is the element that brings everything down on top of you. It crushes any chance a trader has of being successful. Fear is not real; it is a false spirit filled with illusions.

All three of these elements control the very essence of your being. And you must conquer and become the victor over all three. These three elements destroy the core of one's dreams.

Attitude, emotions, and fear are the three that controls the very foundation of being successful with anything in life. It leaves an emptiness of something missing. In essence – you are locked in a box of solitude looking for a way to fulfill your desires, your dreams, and your destiny. And the only way to be successful is to elevate above those things that is holding you back.

Nov 18, 2017 – pg 734

dove_alliance :

I had a free week-end and I will use it for one more tutorial.

Let's begin with the 3 different scenarios with uptrend, downtrend, and consolidation. This is mostly for those who are struggling:

Each scenario is different from one another. And the indicators react differently with each scenario. The uptrend is like a Semi Truck (fully loaded) changing gears climbing up a steep incline. The driver started at 10th gear and about a quarter ways up the incline he is either in 4th or 3rd gear with the pedal to the metal and just creeping up the incline. And an uptrend is basically the same. It struggle's going up with swings in the incline. And sometimes it seems to take forever getting to the top.

EMA on the 120 is the source of support for the incline. And EMA will hold that support until the incline has ended. And the reason is because the bars are above EMA for the uptrend along with ROMAR support.

You take that same Semi reaching the crest of the incline, the driver is then shifting gears up for the decline and the speed had picked up; which means he is hitting bottom a lot faster than he did going up for the top. So in terms of trading the downtrend is short lived comparable to the uptrend. So what is happening you have ranging in the downtrend and swings in the uptrend. And they are different from one another.

Both Ranging and swings are considering consolidation of a trend. Consolidation is only a rest period in the market and evaluating the next move. In an uptrend the evaluation is higher/highs. In a downtrend the evaluation is set on the Ranging mode; Higher/lows and Lower/highs . So when you are ranging the trades are always from resistance and support – never from center.

And this is where the Labels play a critical role for entries. You have to always remember that the LL's (Lower/Lows) and HH's (Higher/Highs) Labels are never an entry point. The reason is because the LL at the bottom or the HH on top can continue for more pips. If you try to go long on an LL Label or short on an HH Label – you can be assured you will be caught. On these two Labels is when the 23.6 has all the say-so for an entry from the 00.0 and 61.8 from the 100%.

But the HL (Higher/Low) and the LH (Lower/High) is a total different story. Those two Labels are your points of entries according to the ROMAR trend on the 120 chart. The LH is entry going short and the HL is entry for the long. And if you had noticed this week all entries were off the HL and LH Labels going long and short. And all these entries were based on the ranging of the ROMAR downtrend with the market getting above ROMAR resistance and then back the other way.

In a downtrend consolidation is mostly ranging – HL and LH; going up and down. And the reason is because the Market is constantly fighting the downtrend. And in my humble opinion; I believe the uptrend is so much easier to trade then the downtrend. And the reason is because you always have EMA hit as an entry point. I believe this is why the traders that are bias for the short are heavier losers then those that are bias for the long. In a downtrend you get short periods of time that EMA will hold resistance; most of the time the downtrend is ranging heavily above and below EMA and this is because the charts resistances are out of sync. The only time you have a steady downtrend is when the 3 support/resistance; ROMAR, EMA, and the Parabolic are all sync for the trenddown; this is also true for an uptrend

And now - the last scenario – the consolidation of a sideways move:

In an uptrend EMA has the control even going sideways. In order for the uptrend to reverse you first need a bar getting below EMA. And then Purple crossing EMA. This is the ONLY way you can get a reversal in an uptrend and/or a downtrend. And all this happening on the 120 Chart. ROMAR may be up or down but if the reversal is happening then ROMAR will eventually cross EMA. Always remember EMA is the life-line for ALL TRENDS. Parabolic must flipped to the other side of EMA to change a trend. EMA must cross Purple to change a trend. ROMAR must cross EMA to change a trend; and pretty much in that order for a reversal of trend. In a slider all three can happen at the same time.

In an uptrend consolidation the 120 EMA is always sliding under Purple for the swings and creating the HL for an entry back into the trend. There will be times the slider is so tight staying in trend that a swing is not created; but only a sideways movement.

In a full blown uptrend EMA will remain as support even in a sliders or going sideways. It is the same for a downtrend. EMA will remain as resistance in a slider or going sideways. Majority of the time reversals happen in sliders when the market is really tight, and so are the indicators. And EMA is the constitutional law of reversals.

In a downtrend the 120 will range getting above and below EMA and then head for Lower/Lows. It is constantly ranging creating Higher/low and Lower/Lows; which means on the 120 a reversal can happen in a cycle; especially with ROMAR traveling downtown central (sideways) and crossing EMA up and down in the ranging mode.

If the market is on top of the Fibo going sideways with EMA below purple and ROMAR is holding support; then one of two things will happen. If the market stays above EMA then you will have a continuance of the uptrend taking the Fibo higher/high. If a bar opens below EMA then you will have EMA crossing Purple for the reversal and ROMAR support is the target with 60+ increments. If ROMAR is 20 or less increments then ROMAR will be broken for the continuance of the reversal at Purple and continue for EMA.

If the market is at the bottom of the Fibo going sideways With EMA above Purple and ROMAR holding resistance; then you have one option. Waiting for an open bar at Purple/Smooth, or above EMA, for entry. And with ROMAR resistance means it will hold the market until ROMAR is at Purple and then it will break ROMAR for the continuance in crossing EMA. If the market does not get above EMA in this scenario then ROMAR will hold resistance for a continuance of the downtrend taking the Fibo lower/low for ranging.

There are more options for a ROMAR downtrend then for a ROMAR uptrend. On Sliders and sideways movement with a downtrend the options with the 4 horsemen is opening up a 40 pip trade. That option is not for an uptrend. All entries on an uptrend is off either Smooth or EMA. In a downtrend you have the option with all of the 4 horsemen

90% of the time with ROMAR holding support in a top slider ROMAR will be broken.

Always keep in mind that ROMAR becomes both support and resistance with the Purple crossing. This also means ROMAR can slide under /above EMA for the continuance of a trend. This is why you always need an open bar above EMA for a reversal for an uptrend; and below EMA for a downtrend.

As you see – you cannot trade one scenario against another. All scenarios are different from one another. You have one scenario for uptrend; one scenario for a downtrend; one scenario for consolidation; one scenario for ranging; and one scenario for sideways. Also take note of how the Fibo works for highs and lows. All swings are between the 00.0 and the 100.0%. All reversal are at the 00.0 and the 100.0% with the 120 chart.

Always remember - no-matter what scenario you are trading – there is always a trend. And that trend is ROMAR. If you are trading an uptrend and ROMAR is resistance; then you are in an uptrend consolidation and you will be ranging. If you are trading a downtrend and ROMAR is support; then you are in a downtrend consolidation and you will be ranging.

One of the most important element in making an Elite Trader, which is also mandatory; is keeping a JOURNAL of everything you learn day by day. Writing down every thing you have learned while studying; and also of your every trade. You do not learn anything in pulling the trigger unless it is after the fact, and then you write down what you had learned from your trades. A journal is your bible as a trader and it is sacred. Without a journal then you have nothing to fall back on.

Let me give some very valuable information about my experience with The Paradox in the beginning.

I started with the Paradox in mid 2004 When the Holy Spirit brought it to me. After the system was completed I sat there in bewilderment. I had no idea what I was to do with this complicated system. Before then I was really struggling blowing live accounts after live accounts. I didn't believe in demos because my ego said I didn't need any demos. It was days going into weeks just looking at the charts. I was too afraid even to think of learning how to trade this system. But during this period of staring at the charts is when I realize it will take much heart, and total faith in learning anything of trading this system. I also knew my ego and fear must be destroyed in order to have the faith I needed to accomplish even a portion of knowing anything of the Paradox.

After spending three weeks, with every moment of my waking time of watching the charts, I learned a lot. The Paradox never lies, or lags, or make any mistakes; but was 100% in all it moves. I had learn every chart was in sync with one another and told a story about the future. I could see many things of showing an entry before it even happens. This had totally astonished me in what I was seeing; over and over again.

After a month had gone by of watching the charts I brought up a demo account, for the first time. And it took me 6 months in learning this system. And I had to do it on my own. There was no-one there to teach me as you traders had me to teach you. After 6 moths I was 90% wins with my Demo; and it was time to go live.

It took me another year of learning before I was 100% on all my trades. Here is my live account from last month. But in order to accomplish this kind of freedom takes a heart filled with humility, faith, and believing in what you see on these charts is truth. You cannot think this "may happen" or that "might happen", or "analyze" anything, or even think with an ego that has a grip on your heart. To be free financially you also must be free of all the negativity in your life. Your heart must always be right in **TOTAL FAITH**.

Jan 8, 2017 – pg 751

dove_alliance :

One of the most negative perspective of being a trader is lacking education. Without education you have no leverage of being successful in the market. And that is true with anything in life. In order to be successful you need heart, desire, and the will of letting go of the false image of being rich as a trader. So let me make this statement very clear..

Having the right heart is the secret of becoming rich; not the image. It is the desire to be educated in the right direction of your own heart that is willing to sacrifice whatever it takes to be the best of the best. And that is the magic of becoming rich "SACRIFICE".

You will have to sacrifice your egoistic self, your own knowledge, your desires of success, your family, your friends, You will have to create an atmosphere of solitude with yourself, your computer, and the charts. When I say 6 months of learning I mean 8 hours a day minimum - 7 days a week - week after week.

You cannot cherry pick the Paradox thinking all you need is a scenario and you got it. The Market does not repeat history. But each variable with each scenario does repeat itself time and time again. But in order to learn the variables you need to know each one and recognize what each one stands for. And to learn you must educate yourself from the very beginning and study, and study, and study each scenario with their own variables; and learn how each one works within its own power in becoming one unit with the Paradox.

You have to always remember the Paradox is truth and never lies. It never repaints, never repeat history, But always on the path of truth as one unit and directs you accordingly with the scenarios and variables.

Each scenario is built with its own power with trend, support, and resistance. Those are the three variables; "Trend", "Support", and "Resistance". It doesn't matter which way the market is moving; consolidation, sideways, ranging, - there is always a trend, a support, and a resistance in each and every movement. All you need to do is learn to recognize the variable and trade the scenario for the variable.

The Paradox is the most powerful system in the world. The reason is because you do not need to analyze, think, predict, or do anything buy only watch the future going into the moment. And each scenario is telling you what is happening before it evens happens. And it is all yours if your have the right heart, desire, and the energy in spending 6 months learning **every detail** of the Paradox that is on this thread.

Traders - The Paradox is not about how much money you can make. It is about becoming the best of the beat. It is learning how to execute an entry without losing a trade. It is about learning how to recognize an entry before it even happens in the moment. It is all about learning about yourself in becoming steadfast in your decisions without doubt. It is learning seeing into the future with conviction of self, **and what you are seeing is truth**.

Jan 12, 2017 – pg 752

dove_alliance :

As I have stated in my last tutorial – learning to trade is not about how much money you can make. That comes after you learn how to trade. First thing is first and that is learning.

The basic is very simple, First you pick a pair to trade (in which I had already done for you as for training). The reason for the E/J is because this pair has 3 sessions to choose from. You have the JPY, the EUR, and the USD. So this gives every trader in the world to pick a session that fits their location and hours of trading.

The second equation of this basic is creating a trading plan beginning from the session you pick. Now - here is something most traders do not know; and that is all pairs across the board begins a new data session at 17:00 EST each and every trading day. That is the time the exchange rate takes place with all currency in the forex market for the next 24 hours. And with the new data at 17:00 EST also wipes out all past history of data and begins a new data for the next 24 hours.

So what does this mean? To begin with you will receive either a plus or minus of the rate exchange in your account if you are in a trade at 17:00 EST; accordingly with the exchanged rate of the pair you are trading.

This also means if you are in a trade at 17:00 EST your trade data is no longer there; and this can very well cost you a trade if you are not in the right trade at the time of the exchange.. So it is very important not to be trading during a session that will take you into the time of the currency exchange; or – you close your trade prior to the 17:00 EST.

Now let's talk about closing trades manually:

Long term trading are for those who had achieved the status of the Elite. And then they begin a process of learning how to trade long term. Long term trading is not as easy as most traders think it is. The reason is because of ranging, swinging, consolidations, and various other reasons. It takes a special skill and a new set of rules in trading long term. It is learning how to enter and exit trades under the condition of a trend using strictly support and resistance. So on this thread there is no long term trading.

So the only trade you are allow to exit manually is 5 minutes prior the High Impact (Red) releases. The reason for this rule is learning how to enter a trade 8 hours prior to the release or after the release. 8 hours prior is learning how to judge the entry with the H4. That is giving you two 4 hour bars to see if you can enter a trade before the release and accumulate your 40 profit. If not – then you wait until after the release before entry. Your goal is learning how to take one 40 pip trade each and every trading day. If you have too close your trade because of a high impact release – then you are a loser.

The question I get often is how do you determine the Red releases for the pair you are trading? The answer is simple. If the pair you trade has the USD then the releases you are concern with is the USD and the other currency, such as USD/JPY, GBP/USD, or the EUR/USD. If you are trading any pair without the USD such as the EUR/JPY then you must include the USD for the releases. So with the E/J you have the EUR, the JPY, and the USD to keep tract of with the economic releases.

You have 3 impacts – Low, Medium, and High. With Low impact you very seldom have any movement in the market to worry about accept for the JPY. The JPY will use Low impact releases to move the market as much as 100 pips if they feel they needed income for their banks. You have to realize the market is never moved by traders. The Central Banks own and moves the Foreign Exchange market.

One thing have always learn when it comes to economic releases and that is; no-matter what happens on a release the ending is what counts. If the market is in a downtrend in the beginning of a release it will end in the downtrend. If the market is in an uptrend on a release then it will end in an uptrend. In other words; if the release was Red and pulls back from the trend 40 – 60 or 80 pips then it will return back into the trend and vice-versa.

Now lets talk about creating a trading plan. You traders are missing the boat. Creating a trading plan is easy. The problem is seeing what you had created. There are 3 trends on each chart and they are: ROMAR, EMA, and the Parabolic. Now think about that for a moment. Three trends and each one is both support and resistance depending of their location on any of the charts. And what is beautiful about these three trends is they run in sync from one chart to another. You have 4 charts with the Daily, The H4, The H2, and The H1. The H2 is your trading chart being mid-ship and the balance for the other three. If you follow the rules for counter-trading with a trend then you will always know which direction to trade. It is a MUST in seeing the big picture before you will ever make it with The Paradox. You have three trends on each chart and each one are deadly stoppers as resistance and support. Each of these trend indicators can place you in a ranging mode for days or even for weeks. You have ROMAR on one chart as resistance and on another chart you can have the Parabolic as support with a little as 40 or less pips between the two charts; and how many times have you pulled the trigger from center hoping for a WINNER? Too many times. What this is showing me is your traders are not learning or studying.

As I have said many times – The Paradox is about support, resistance, and trend. All you need to do is when you create your trading plan is be showing support and resistance along with the trend; and then recognize each one on each chart and you have a winner. Too many of you are followers creating some other's trading plan and not creating your own. I always say – get smart and learn in creating your own sense of achievement. Following someone else will only bring you down along with that other person.

Jan 30, 2017 – pg 761

dove_alliance :

When the market moves the Last 0.0 bar to the 40 spread the Fibo that is attached will move to the next higher/lower bar and and reattached. As you can see the next high is at the SAR 125.275. This is also true at the 100.0. The FIbo will change direction at the 61.8 when a new Fibo High or Low is created at the 40 Spread and reattached with either the DB or SAR. As you can see the H2 had shifted when the last 100.00 lost the 39 spread and flipped at the 61.8 to 0.0 and changed the 0.0 above to 100.0 This is how the Fibo flips.

Both Divergences is control with the DB Only. As you can see the DB is attached at the Fibo high and because the Fibo had shifted RED it is set and the Standard Divergence is also set with the DB. You had the Hidden divergence connected for the 125.226 SAR which means a retrace to the 61.8 which was a Red Fibo for 40 pips. Because of the Fibo flip the 61.8 is now on the top with Fibo Green. If this gets below the 61.8 then it will continue south.

dove_alliance :

I got a question from a trader as a PM and I will post it and answer the question as I feel it was good question for everyone:

The Question:

Hi Sir, You replied on iris's post saying this statement:

"You must always visual each chart and see what is happening before pulling the trigger. The H4 with a Red Fibo and the 23.6 being support - you needed a bar opening below the 23.6 for entry going short. There was no long entry just because of the H4 Red Fibo. And that is not going to change until the low at 123.779 is no longer a visual."

Sir, I'm confused of 23.6 Fibo is being said as support. Did you mean 23.6 as a resistance? I will need your reply Sir, Thank you and God blesses.

The Answer:

In my tutorials I had spoken about the support and resistance with the Fibo. The 23.6 and the 61.8 are very heavy support/resistance depending on direction. On a Red Fibo with 0.0 on top **as support** (correction: as resistance) you have the 23.6 your first support. Once the 23.6 is broken with and open bar then the 61.8 will be the target for your second heavy support. You also need an open bar below the 61.8 before you take entry.

Reverse this and you have the 0.0 on the bottom as a Green uptrend Fibo with the 23.6 and the 61.8 as resistance. And again you have both levels heavy Resistances.

In the moment you had the H4 Fibo hit the 61.8 Support and the H2 at the 0.0 Green Fibo.

The H4 is your dominate Fibo for trading. And because of the 61.8 Fibo on the H4 is Red, being support, means you must wait on the H2 for either a slider or turn. If it is a slider then the H4 will show the 61.8 being broken with an open bar for a continuance of the downtrend.

I had to Make a correction between support and resistance. The reason is because the Red 0.0 is resistance and the Green 0.0 is support. The 61.8 and the 23.6 are BOTH SUPPORT AND RESISTANCE depending on direction of the trend.

dove_alliance :

OK traders - I had given everyone an entry off the H4 61.8 and the H2 0.0 hits. That was confluence with the Fibo. But no takers for the entry. The only way this will work properly is the spread of 40 with 39 showing on the bars. If you do not have the right spread then the fibo's are useless.

As everyone can see how the 61.8 and the 23.6 works as support and resistance. Coming off the H4 61.8 and the H2 0.0 was entry heading back to the top. If you also had noticed I had seen this before the fact, looking into the future, in exactly what the market was going to do. There was no thinking about it or analyzing anything; only following the rules of the Paradox and I do not lose. This is the reason why I brought it forth; as I had seen it before it even happened.

The Paradox is limitless in opportunities of taking 40 pips each and every trading day. This is why the Paradox is a 6 month process of a college education in learning. Every indicator has a purpose and reason for the Paradox to be limitless for entries and exits; and there is no other system in the world can do as the Paradox does.

††

Let me give everyone another reminder as I have given many, many times. The Paradox is about **support**, **resistance**, and **trend**. If you are trading outside of that realm then you will lose your trade.

Feb 5, 2017 – pg 763

dove_alliance :

Divergence is a big problem for most of you so I will give a an explanation of how both regular and hidden works.

The chart below is showing both the bottom and top with divergence and they both work the same. On the bottom you have showing where both the regular and hidden attached. A retrace takes place back into the Horsemen to bring out the hidden; you also have have the bottom of the Fibo at the retrace. You then have the market back into the trend and you have the hidden showing with the regular.at a new bottom Fibo. You never, ever counter-trade this pullback (retrace) as there is never a 40 trade in this kind of pullback. Your entry for the long is once you get an open bar above EMA.

On the top is the same accept when you are in an uptrend you need patience because you will experience bumps on the Fibo. And the bumps are usually not heavy but only a few pips. Once you get an open bar below EMA you can make an entry short.

If you are in the right trade you will get your 40 before the Fibo. Once you get the standard Fibo it is time to wait on the turn.

††

Quoting Iris2018

Sorry please sir for tactlessness. I'm trying to understand your input. For me, he is still beyond comprehension. You entered from the nearest resistance (smooth H2), but you have EMA (support), parabolic (support) and the candle is open above the level of 23.6 fibo H2. Is it not a risk?

Everything you say is true. What I have been doing the last couple of weeks is teaching in how to use the Paradox Fibos. The Fibo is a very heavy support and resistance; especially off the 0.0 line. In this scenario you had the 23.6 hit and held for a pullback (retrace) back towards the 0.0 line. Because of the DB with Divergences at the 0.0 line you had a reversal in the makings. So - in order to get in for the reversal you had to wait for the right opportunity for the entry going short. That means the 4 Horsemen had to be in the set up for the entry; and the market must also rotate below Purple.

If you notice mine and The-Force entries you will see the set up for the short that I am speaking about. You had White/Smooth crossed Purple; an open bar below Purple with EMA just below the entry and the Parabolic in position for a flip. Now - if I had waited for an open below EMA I would not had taken the trade because of ROMAR support. If ROMAR was traveling through downtown central (at Purple) then I would had waited on EMA for the entry. But I already knew what was happening because of the Fibo with DB/Divergence - so all I needed was with the opening below Purple to take entry.

The exact same scenario is on the bottom of the Fibo and this is the ONLY TIME you can use Purple for an entry which is off the Fibo reversal.

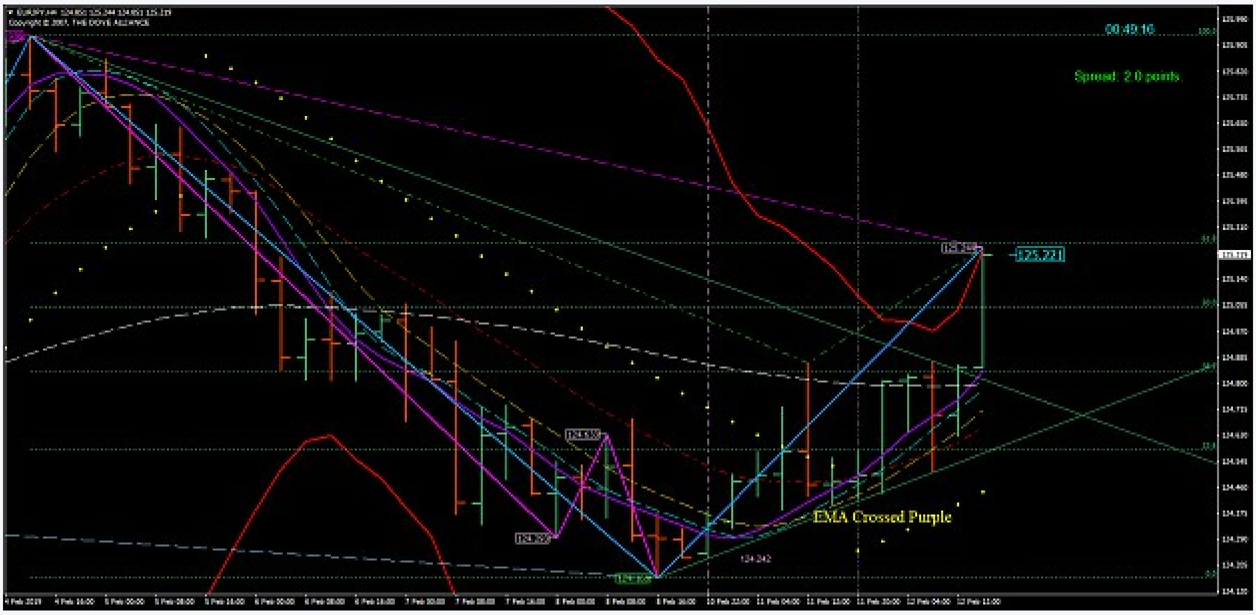
As I have said many times, the H1 is a reference chart. And what do I mean as reference? The H1, in many ways lead the market as for signals are concern. Especially with the EMA, MACD, and ROMAR signals. So Let me give you traders an example.

On the H1 you have the opening bar at 17:00; and on the next bat at 18:00 an EMA alert takes place. Looking at the MACD you visual the bars heading for the zero line. On the next bar at 19:00 you have the opening above EMA. Take a visual on the MACD once again, you see the next bar will bring up the MACD zero crossing on the 20:00 bar.

Taking a visual you will notice ROMAR traveling downtown central (going through the trading area) and it is heading for Purple, and then EMA. How do you know this? Because of the market getting above EMA.

Now lets take a look at the H4:

To start with - you have EMA crossing Purple - on the same bar the Parabolic is flip-flopping with White and Smooth in an uptrend. Just looking at this H4 (in the moment) is telling you the market is heading upstairs for a trend. In other words the H4 is reversing heading for the 61.8



Now lets take a look at the H2 (your Trading Chart):

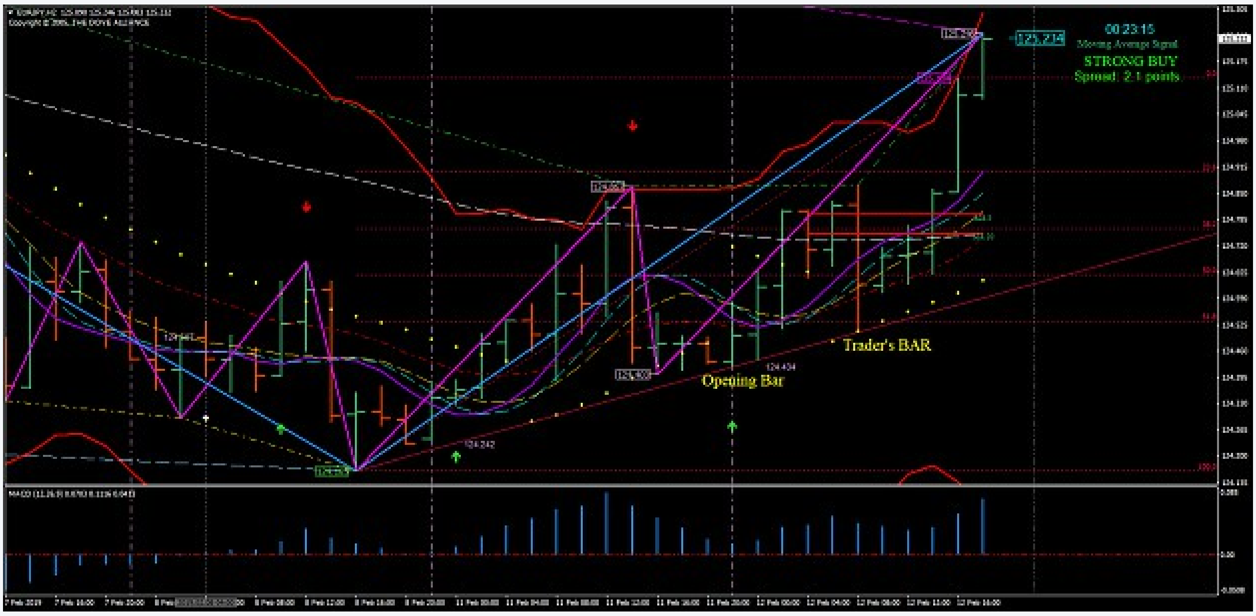
The opening bar - in which is already moving from the closing - you have an EMA signal. You also have the SAR attached on the bottom for an up. Because this bar is already moving with an EMA up arrow; I will use the H1 signals EMA Arrow with the H2 signal; Confluence.

Now lets take a look at the losing trades going short.

To start with I ALWAYS create my trading plans off the 17:00 ET timezone BAR. It doesn't matter what time I can get to my charts; may it be at 20:00 or midnight or whatever time it may be - I create my plan right off the opening of the day,. This way I miss nothing that had happened from the 17:00 bar.

You traders that had gone short, and if you had gone through everything as I did above you would had seen the entry long (with no problems what-so-ever).

You already know the trend is up on the H4. On this H2 you see ROMAR going through center heading for Purple/EMA for the up trend. You also had seen DB/SAR attached on the Red down bar with the Standard Divergence. This means the market will hit the Parabolic and head north to bring out the Hidden Divergence.In which it did. You are now in a full-blown uptrend with the H1, H2 with the H4 working for a full-blown trend heading for the 61.8 of the H4 Fibo and the Daily Parabolic.



It is very simple traders in seeing what is happening before pulling the trigger. You create your trading plans exactly as I had created mine above. This way you see everything on all the charts along with the trend, support, and resistance BEFORE PULLING THE TRIGGER.

Feb 14, 2017 – pg 769

dove_alliance :

In the last 24 hours there was 2 entries. One off ROMAR with the first hit - waiting on the next opening bar taking entry for the Long. The next one was the Parabolic downtrend and again, seeing the first hit - waiting on the next opening bar taking entry for the Short. Both entries 40 each. The ROMAR hit had the Standard Divergence with the SAR attached which was an automatic hit to the Parabolic downtrend. Next move was to bring out the Hidden divergence below the Standard Divergence. These are trigger moves in which I have been teaching you traders for over 3 years. And still - I haven't seen any of you picking up anything I have taught you. That means none of you had spent your free time to study and learn. My time is valuable and I won't be here as much as I have been. If you want to be one of the Elite Traders then I suggest very strongly in learning in what I have taught you in these last 3 years.

dove_alliance :

The 4 Horsemen:

Four figures in the Book of Revelation who symbolize the evils to come at the end of the world. The figures represent: **Conquest** rides a white horse; **War**, a red horse; **Famine**, a black horse; and **Plaque**, a pale horse.. They are often call the Four Horsemen of the Apocalypse.

The 4 Horsemen are the basic of the Paradox.

Meaning of Paradox:

"A statement or situation that is true but seems impossible or difficult to understand because it contains two opposite facts or characteristics."

The two actions having seemingly contradictory qualities or phases is support and resistance. The reason is because everything within the Paradox is both - support and resistance in which everyone is having a hard time in understanding. In other words - each of the 4 Horsemen are both support and resistance. This also includes ROMAR and EMA.

What you traders are having a hard time with - is what you what have been taught in the past that support is bottom and resistance is the top; which is conventional wisdom. You have to realize the Paradox is by any means conventional. What you have been taught by others in the past has absolutely nothing to do with the Paradox.

This means you have to come out of the darkness and see things in a totally different light. You have to learn the truth of support and resistance within the Paradox. You have to learn in recognizing support and resistance of each indicator. Each indicator within the Paradox is filled with power of support and resistance that is not seen on any other system.

What you have been taught as a trader that support and resistance are horizontal lines; but it is not so with the Paradox. Each indicator, being support and resistance, moves from bar to bar and changing their location of power. If the trend is down then their power is moving lower lows; and vice-versa on an uptrend.

What you traders have are blinders on as if you are in a horse race. What you traders need to do is take off the blinders and broaden your understanding of what is true. Most of you are waddling in the garbage pit of your past history. Trying to hang on with what you have been taught. And I understand this because that is all you have to trade with.

This is why traders have a very hard time making it in this world of trading. The market is unforgiving and has no mercy. Without the wisdom and understanding of support and resistance then you will fail; just as those have which you had followed.

The mechanics of the 4 Horsemen is not complicated. They are a revolution of continuance cycles generating supports and resistances. You have to visualize the actual top from the bottom and the bottom from the top. You have to visualize sideway moves (sliders) and connect the trend with those moves. But most importantly - you must connect that little yellow dot (known as the Parabolic) as the source and true power of all trend cycles and reversals. That little yellow dot is the true revelation of when a cycle/trend begins and ends. And every time you counter-trade the Parabolic you will lose your trade. This is the reason the H2 is your trading chart (it is true in all aspects of the Parabolic). The H2 is not a standard trading chart. The power of the Parabolic for support and resistance is the actual revelation between success and failure.

In theory the standard PSAR (Parabolic) flips when a bar hits it. This is not true with Paradox Parabolic. It will flip and set in stone when the market is ready to reverse in either cycle or trend. And for some reason you traders are not getting this revelation. 100% of your trades are failing is because you counter-trade the only indicator that will stop you dead in your tracks; and that is the Parabolic.

Now Lets take 2 other variables that capes the support and resistance. And that are the DB and SAR. The DB is long term reversals; and the SAR is used for entries in the trend.

This is very important. These 2 indicators (DB/SAR) are the ONLY indicators you use to counter-trade the Parabolic. The reason is because the SAR uses the Power of the Parabolic trend for entries.

When they are together (DB on top of the SAR) means you are ranging and/or reversal. The phenomenon of these 2 indicators is a true visual set up for both entries and exits. These 2 indicators is the reason why you traders fail. Meaning you are always counter-trading these 2 phenomenons. So many times I see entries with the DB/SAR on the bottom; with less or more than 40 pips to the bottom and you pull the trigger for a short; and vice-versa for the long. It just blows me away when I see that. You traders are constantly trading against the Power of the Paradox.

Let me give you some examples with the DB/SAR and the Parabolic's. These 3 indicators are 80% of my entry profits. The other 20% is using the Parabolic on reversals.

On this screen shot starting with the upper letter A you have both the Hidden and Standard Divergences with the DB/SAR attached as resistance.. Any time you see this happening means an automatic reversal. DO NOT EVER COUNTER-TRADE THIS SCENARIO.

On the lower letter A you have ROMAR and EMA holding both support and resistance. The reason is because ROMAR had crossed Purple (going through the trading area) is now both support/resistance; and EMA is support in the uptrend with the Parabolic.. So in reality you have not trade with support AND resistance.

On the lower letter B is very import for a trader and the reason is because You now have both Hidden and Standard Divergence attached as support with only 60 pips from resistance to support. You also have ROMAR crossing EMA is now support. EMA is now sliding for Purple to become resistance.

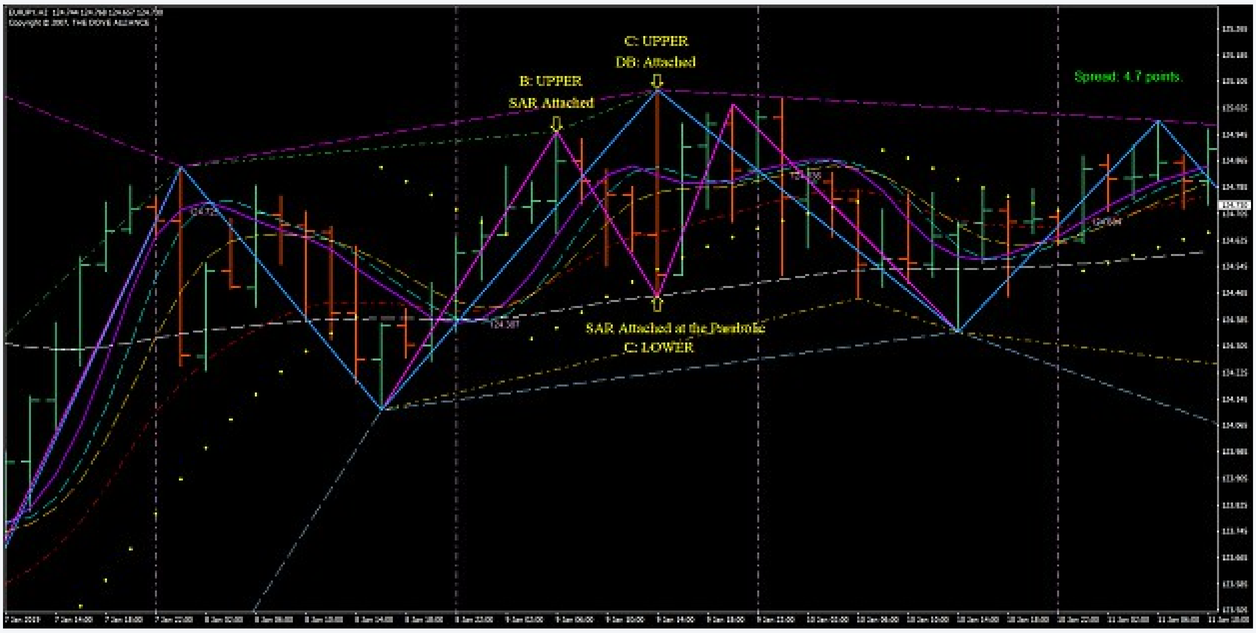
Now - looking at the moment with everything attached on the bottom of this bar - what do you see? To start with you have the 4 Horsemen in a shallow cycle because of how Smooth crossed White. This means White and Smooth will cross Purple once the market gets back above Purple. This also means ROMAR will continue sliding under EMA for a trip up stairs. In the moment you have ROMAR as support and market is below support and you must wait for the market to get back above ROMAR. Three bars later you have exactly what you are waiting for. Patience is the secret of being successful. You had the opening bar right smack on top of both ROMAR and Purple for entry going long for an easy 40 pips. Also take Notice of EMA crossing Purple for support after entering the trade.

The next attachment was with the upper B SAR after giving up your 40 pips. Another reason to never, ever trade from center. You always trade from the bottom and top.

With this SAR attachment you are lacking 40 pips with the target being the Parabolic support. You also had both Divergences attached.

We will move on to the next screen shot:

On the lower C SAR bar you had a small spike to bring out the Hidden Divergence with the DB attaching. This happen during an economic release. So you have the SAR on the bottom and the DB on top with the same bar. This means there is NO Trade going either way. You have EMA, Parabolic, and ROMAR holding support. You have the DB, Hidden / Standard Divergences as resistance. There's not much room for a 40 pip trade. In order to have any trade what-so-ever you need both attached together for a ranging mode. In this scenario you need at least a 24 hour period before that will happen. Especially with ROMAR as support.



Roughly 24 hours later you have both DB/SAR attached at letter D with DB on top of the SAR, both Hidden and Standard Divergences are also attached.

With this screen shot below I have an arrow pointing at the Standard Divergence. What you traders are not realizing is the Standard Divergence is also a very powerful trend line for both the top and bottom in the ranging mode. But the problem is you do not see it until it connects to the next bar as being divergence. The next screen shot I am placing the trend line.

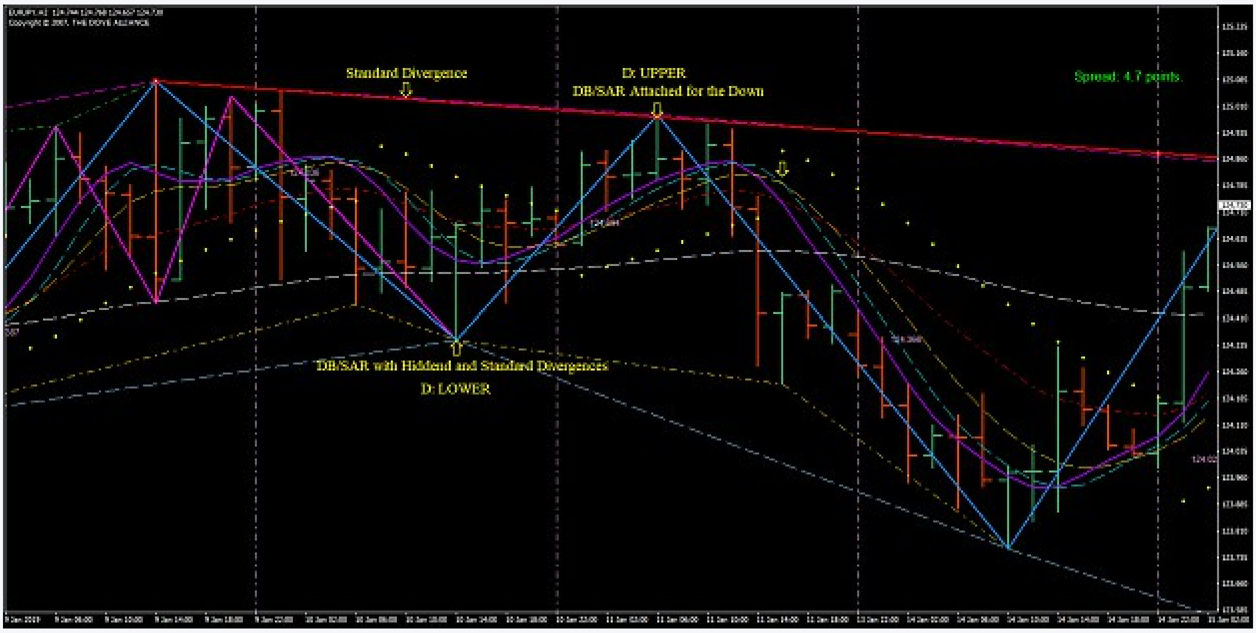
What you do is draw a trend line from the top of the bar with Divergences to the top of the next high bar, and you will have an accurate pip count for profit.

Taking a look at this picture below you will notice a couple of things. With the attached trend line hit you are looking at a down slope trend. This means instead of a higher/low up ranging mode - you are now looking at a down ranging mode. This also means the volatility of the market is heavier for the down instead of the up.

With the connection of the DB on top of the SAR for the down you are now in long term ranging mode.

ROMAR is tight being within the trading area with the 4 Horsemen slopping a cycle for a turn. With both EMA and ROMAR holding support You need an open BAR below EMA for a trade going south with Purple turning. This can happen with an open bar below Purple. The Arrow is showing the magic with Smooth crossing White and EMA crossing Purple for the down cycle with the open bar below EMA and just above the Parabolic for a flip..

If you was on your chart and totally focus you will notice the actual entry which was the opening bar after the EMA support hit that made its way just below the Trend Line for the entry short. For one thing you must always believe and have faith in what you are seeing is truth. That trend line I drew is truth. and will never be broken as it was created by divergence. If anything the Line will be touched. It will stay true to the next divergence connection. Another entry was with the Market balancing with Purple below ROMAR for 40.



As you noticed the market is moving Lower/Highs, and again you have Divergences attached with DB/SAR on letter E. Also take notice the created trend line is the target; and all you need is 40 pips. Between the Low Divergence and the High Trend Line is 100 pips. You have ROMAR, EMA and the Parabolic as resistance.

In order to make the perfect entry as not to experience pulls back into a deep hole - Your entry must be as close as you can get with Purple. In the moment with the SAR/DB connection you do not have 40 pips to resistance. That means you must wait with patience for an OPEN bar at Purple. As you notice I had 2 entry arrows. One at Smooth and the second above EMA. Both entires was for 40. You have to always keep in mind you are in a ranging mode and Divergences are the target from hight to low; and low to high.

It is pretty hard to draw a trend line if you do not have a bar to use as reference as I did on the upper trend. But there is one way to measure distance for a pip count in this scenario. Another way is to determine the last lower/high divergence. It was 100 pips from low to high and it will be the same coming off high to low. And because you are in lower/low ranging mode this means you can attached anther 20 pips to the tally which is 120 pips to the target.

You have the market above ROMAR and EMA Support at divergence. This means you have two options for entry. First one is at the trend line (Divergence) or the next open bar. If you wait then a possible hit with Purple Provided you have the extra 20 pips getting below the bottom of the last divergence connection.

In ranging your greatest value in making profit is off Divergence. There may be times you may get a 5 or 10 pip bump but never your SL - unless you was trading a trend. And that is totally a different scenario. This tutorial is all about ranging and has nothing to do with trend. I will post this tonight and tomorrow I will write up a tutorial on the trends.

Feb 19, 2017 – pg 771

dove_alliance :

On this tutorial I have taken this week showing my trades. Each entry are for 40 with TP/SL of 40 each using the H2 and H4 charts with the Daily as reference. My trading style is long term with a projected 200+ pips weekly. But for this week I will be trading only 40 each entry so you can see how it should work for each of you. Also I may be taking several 40 trades in breaking the rules without a trading plan as to catch the scenarios as they happen.

You will notice I use strictly support and resistance and never trade from center. We are still in the Ranging Mode and the reason is because ROMAR on the H2 and H4 are still going through downtown central (center). But once the H2 ROMAR begins holding Support or Resistance then ROMAR will slide out of center back to normal.

On the first chart below is from this last Friday. And since Friday at 17:00 ET the market will close, means I need to visualize the market before the market closes, and see if I can choose an option for an entry. In other words - I must eliminate any risk for a projected 40 pip trade.

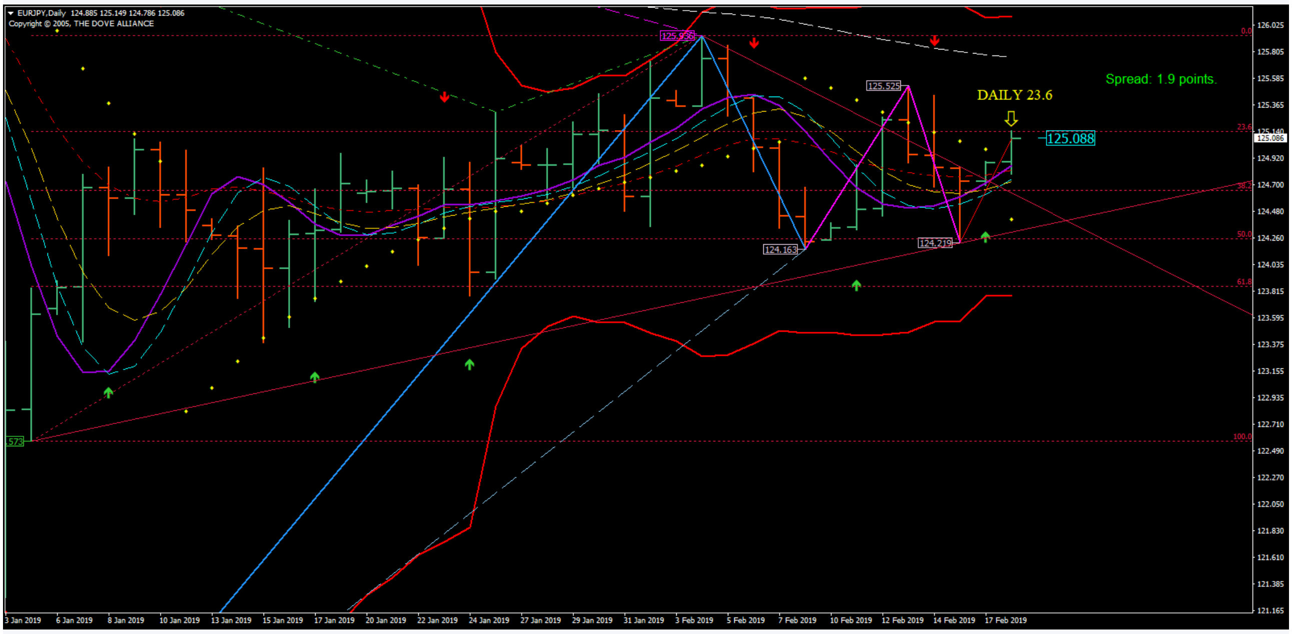
Mid Friday you have the bottom hit with DB/SAR and Divergences. Looking at this scenario I see there are no entries for the long before the 17:00 closing. The reason(s): EMA as resistance with no bar above EMA,, the Parabolic as resistance, and ROMAR as resistance. That means my week is finish and wait until Sunday's opening.

With Sundays opening we have the H4 and Daily Fibo's Red Projecting entry for a short at the 23.6; with ROMAR going through center on the H4 (being both support and resistance); and the Daily ROMAR holding resistance.

The reason both H4 and Daily 23.6 being resistance is because the H2 Fibo is Green and up; which places the market is in consolidation. You also have the Standard Divergence showing up just below the 61.8 resistance. The pullback is always into the 4 Horsemen on an uptrend, and usually Smooth is the one that gets hit. This means the opening on today (Sunday) was an entry for the long and the the H4 23.6 Fibo resistance as the Target. With this entry I had EMA crossing Purple which means ROMAR will not hold resistance with the 4 Horsemen in cycle for the up

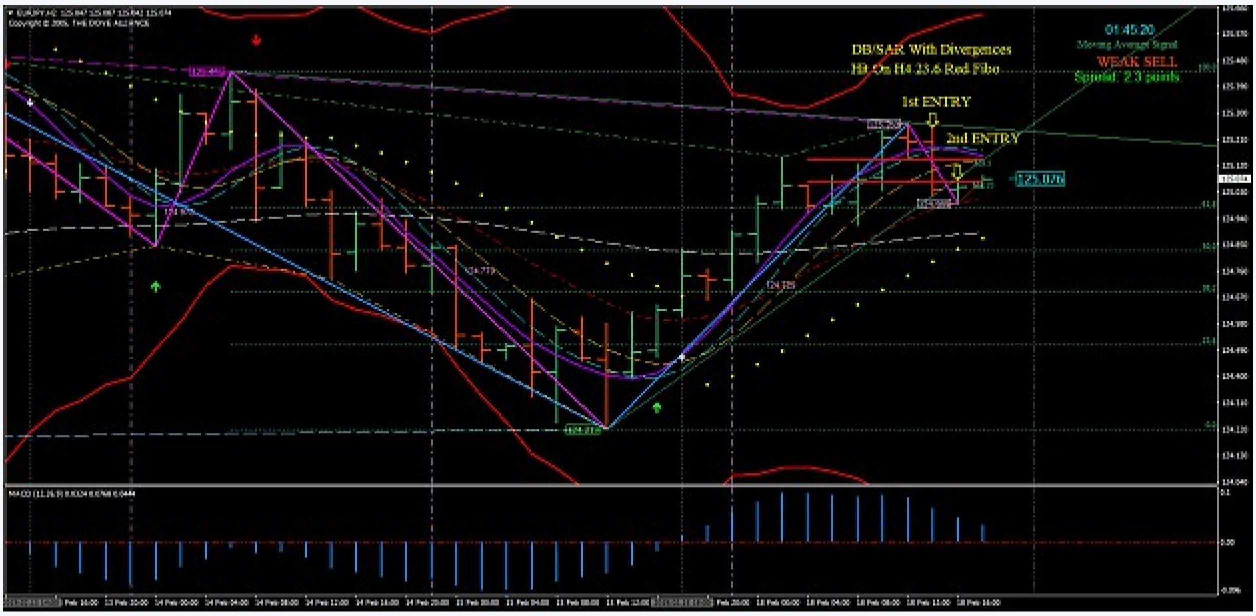
This next screen shot is showing the market got above the 61.8, and I’m still looking for the 23.4 and also the pullback to bring out the Hidden Divergence..

Here is the Daily hit on the 23.6. Because the H4 is the true reference for the Fibos means the Daily will get above the 23.6 and hit the H4 23.6, then retrace back below the Fibo Line.



On this screen shot you had the pullback to bring out the Hidden Divergence to Smooth and back to the H4 23.6 for an entry short. The second entry was a possibility IF the market gets below EMA. In which it did not. The reason for bringing this to your attention is because EMA has the control of all cycles in crossing Purple. As you can see EMA is a long ways from crossing. You need the opening bar below EMA to pull Purple down for the crossing to continue the downtrend. The same is on an uptrend.

Now take a very close look at this Picture. Take note of EMA and ROMAR in the early stages of being support with the Parabolic below ROMAR. This visual is telling me a story which is: The market is going slide sideways for hours before getting below EMA. But here is the rule for taking an entry off the top or bottom is always 40 pips to target. My entry was off the top and the target is below ROMAR SUPPORT.



Here is the Hit on the H4 23.6 and the next bar got below Purple for a rotation. Also take notice of the last 39th bar. Once you have a new bar in 3 hours, 8 minutes and 34, seconds you will also have a new Green Fibo with a new bottom. Once that happens does not change the scenario I am in because of Divergences on top

Just always remember everything with the Paradox is in THE MOMENT.

On this screen shot is showing the EMA arrow with the MACD arrow on the next bar; with the SAR attaching to the Parabolic. I have just over an hour before the next bar. The next bar should open below EMA and ROMAR because of both EMA and MACD arrows, and hit my target for profit.

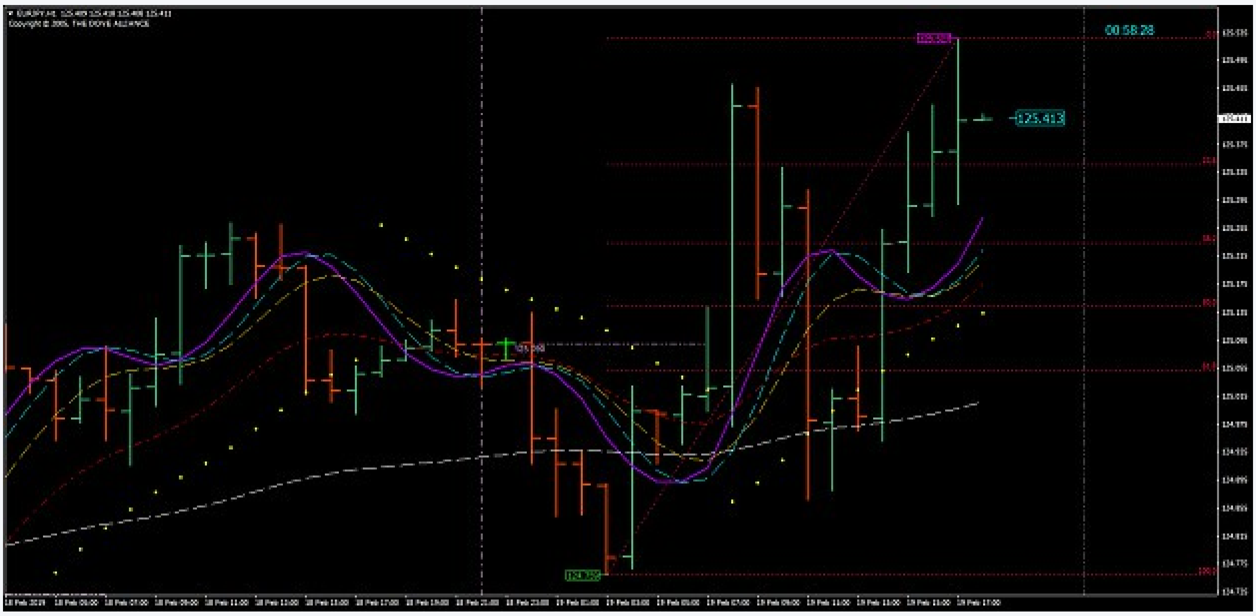
Alright Traders - I must leave now and will be back tomorrow. But looking into the future I can tell you exactly what will happen. Because of EMA and the MACD Arrows the market will get below ROMAR (which is blessing for my trade) You will also have the DB connected on the bar below ROMAR with the SAR. On the next bar you will have an opening for the long. All because of ROMAR is in a slider under EMA.

OK Traders - I am back from my trip out of town and with the screen shot above is showing my trade was taken. I am also noticing ROMAR is back in business with holding support.

If you really paid attention to this posting you would notice how I traded in the moment with each step, looking into the future beginning since last Friday. Also take notice in the moment I am using strictly support and resistance. This is the way you need to learn how to trade. If you can learn what I am teaching then you will become a very special trader.

This scenario above does not happen often which is called an ROMAR slider. But the variable is the same with entries off the Top for a short; which is different from the variable off the bottom. As I have mention in the past - the Variables are, Short Trend, Long Trend, Ranging, and Consolidation. Which means you cannot trade one Variable the same as with another. The reason is because the rules are different on each Variable from one another. You cannot Trade a Short Variable with a Long Variable; and so forth.

Also take notice that at any time did I use or reference the H1 chart. This is the reason showing below. I have the basics on the H1 only. Purple, ROMAR, Fibo, Candle Count Down, Period Converter Opt and the Session indicators. I use the H1 for reference only with Sync and entries such as ROMAR, Fibo, and the Parabolics. The H1 is not, and I repeat, is not a trading chart.



††

pg 772

OK - here is my trade for today.

This first screen shot is showing the H2 DB/SAR attached with Divergence. Looking at the other three charts I see each of the three matching Red fibos across the board. But in this visual the Daily Top at 0.0 is more than 40 pip for an entry. Also the visual is showing a full bloom trend on the three trading charts. What I would need is the H2 balance with Purple on the H2 for an entry going long..

At 17:00 ET I have Purple holding support and the market balance for the entry going long.

Fibos Red and Full Blown for the uptrend.

H1:

H4:

The Daily 0.0 is being hit and profit taken;

Feb 20, 2017 – pg 774

dove_alliance :

Here is another tutorial for the last couple of days.

Entry Long off H1 38.2 Fibo which was also below the H2 23.6, and the H4 Smooth Supports (Confluence). Sorry for being late on the charts Visuals. Was called away before I could create them.

All trading charts have a full bloom uptrend lacking the Daily ROMAR as resistance. The Daily chart came short a few ticks of hitting the 0.0 Fibo. This means after retrace the market will continue up to hit the Daily Fibo so the Daily (along with the other 3 charts) are placed in sync once the New Higher/high is established.

Here is the second entry for the long with the market above Purple. The reason are above for the entry I had made previously. There is a Red Tag at 14:00 today with the dollar FOMC Meeting Minutes. 90% of the time the Red Tag will move with the trend. It is that 10% that is always at risk; especially with the dollar. So in reality the entry is not to be taken with a RED TAG around the corner; and I will close my trade just before the release This means I have to wait for the next opportunity; and I need to readjust my visual; will explain later.

OK - the Red Tag release took the 10% route opposite of the trend. This means if you had taken the entry above you would now be deep in the hole. So never trade a Red release and always check before entry for these releases.

This release also changes the structure of your trading plan with a new entry, another moment on a different bar. What this means is I have to shift my visual from a long to a short. The reason is because with the previous bar opening ABOVE Purple was the entry for the long. Now - that entry is gone because of the Red Release that had placed the MACD short.

Shifting to the short and checking the H4 open bar; I visualize the opening below Purple and heading for Smooth. This also would be the H2 EMA hit. When you have support or resistance on the H2; you will also have support or resistance on another chart with a different indicator.

Market Open below Purple. Now here is what I am looking for; You have the Parabolic within striking distance for a flip. I will wait on this bar for the movement up and down trying to get above Purple.. You have to be patient with a slide. If the next bar stays below Purple there is an entry going short. .

Well - the bar did not make it back above Purple resistance. But my entry must have 40 pip to the H2 ROMAR and looking at the H4 with the Daily and visualizing the H2 - I have a major problem for ROMAR.

The H2 has the 23.6 with the H4 also having the 23.6 which could be broken. BUT - the Daily has a double whammy with the 23.6 and Purple right on top of the 23.6. The risk is too great for any trade going south. I am finish for the night. That was a pretty bad slider.

For you traders that was guessing means you really need to learn how to visualize the future in the moment of each bar on each chart. If you trade London means you start your trading plan at 17:00 ET; and visualize each bar to see what was happing up to the time you started your plan. You have to always remember at 17:00 ET you have a new Data for the next 24 hours. If you don't, then you will miss the truth on what you need to know before pulling the trigger. This means you need to set up your Session indicator properly for 17:00 ET on the H1 through the H4 as a visual to know where 17:00 ET is on your charts.

Also take note of the Red Release. Even though the release had disrupted the entry; it also can disrupt the projected target. This is when support and resistance becomes critical on your projected entry. And in a slider is where it will change as it has done on this slider. Then you need to readjust your trading plan after the release if you haven't yet made an entry..

Through out my tutorials this week I had taken pictures with the various hits so you can see how the Paradox runs in unity for confluence. The Paradox does all the thinking for you. All you need to learn is how to visualize the charts in the moment without trying to analyze anything. The Paradox does it all for you and is always 100% RIGHT.

What I am saying is you traders must (in someway) establish belief and faith in the Paradox; and forget all that trash you have consumed from history. It is totally about attitude in wanting some something so badly that you can't even achieve it. The wrong attitude is the destroyer of your dreams. Thinking or analyzing the market is beyond human nature. Because the market is there for only one reason; and that is to steal your money. There is only one attitude in being a trader and that is an attitude of having faith and believing; just as it is with anything else in life.. And the only way to beat the market is through support and resistance. The Paradox is the only system in the word that guides you into a destiny that dreams are made out of. My faith is in the pudding with each and ever entry. I totally believe in The Paradox Support and Resistance.

This week I have taken each of you on a journey of support and resistance; and there was nothing there about analyzing any of the entries. All my trades were in the moment looking into the future. And all entries were spot on without going deep into the hole before profit. What makes this extraordinary is I posted each step, with explanations, going into the entry. So from this day forward there should be no more excuses.

I need to rest from this time consuming task. So this may be my last posting for the week. My trading style is not sitting at the computer around the clock. When I create my trading plan it is already established where my entry is going to be. And that is because everything on my created plan is done in the moment, looking into the future using support and resistance of ALL the indicators.

€$£¥

Feb 21, 2017

dove_alliance :

Traders - it you haven't study the rules for each of the 4 variables; then I strongly suggest that you do. Each variable has their own rules. Example of how the Hidden Divergence is brought out such as my posting with Karma. He should not had taken that trade if he had know the rules of the Divergences. Even without the rules the Parabolic will stop a freight train from breaking through in either up or down trends. In ranging the Parabolic is pretty much eliminated going from high to low and vice-versa. In ranging it is strictly about support and resistance of the highs and lows.

Just like that short trade I refuse to take because of the Fibos with Purple on the Daily. I never at any time underestimate the power of the Paradox. It would be the biggest mistake I could ever make if I did so. This is why traders come and go because they have no concept, or understanding of such power in a trading system. The bottom line is they have no faith in order to believe.

This kind of move going sideways off the top of the Fibo doesn't happen often. And for me it is stressful because the only indicator that can be work with is Purple for a breakout. And with the market moving above and below Purple on each bar; then a Red release on top of that, makes the visual a must with true patience. More than 8 hours before the breakout had shown up. Then I had to be sure 40 pips were in the makings before pulling the trigger. And as you had seen - there wasn't.

This kind of patience does not happen over night. It is a conditioning that one must work with in every day life. It is a conditioning of focus with visuals that must be the very **FIRST PRIORITY** in trading. Without it you have no chance of being successful. Each of you must learn and totally understand the meaning of "*Trading In The Moment*". Without trading in the moment also means you will not be successful. And my past tutorials had proven that.

This means you now must change your perspective in how to trade. In order to look into the future as being a trader as a profession; you must change your attitude and perspective in how to trade. It is truly an education of oneself in learning **EVERYTHING ABOUT TRADING**. It is this scenario you must change in order to reap the fruits of success. If you refuse to educate yourself then you have no future as a trader.
