Weekly Profiles are patterns that represent typical price behavior throughout a trading week. These profiles are composed of bullish, bearish, or range-bound movements and can be used to anticipate potential market moves.

What Are Weekly Profiles? Exploring ICT Weekly Profiles

ICT (Inner Circle Trader) Weekly Profiles refer to recurring price behavior patterns observed during the trading week.

While these profiles do not provide precise predictions, they offer a framework to better understand overall **market trends**.

To use this model, you need to be proficient in **Premium and Discount** concepts.

Classic Tuesday Low of the Week

In bullish conditions, prices typically fluctuate on Monday and Tuesday, **staying** above the **discount** level on higher timeframes. Prices drop to the discount level by Wednesday, forming the weekly low.

If this drop doesn't happen on Monday or Tuesday, the low might be set on Wednesday during the London or New York sessions.

Wednesday High of the Week

In bearish conditions, prices on Monday and Tuesday may be manipulated to fluctuate below the **premium** level on higher timeframes.

Prices rise to the premium level by Wednesday, forming the weekly high. If this **upward movement** doesn't occur on Monday or Tuesday, the high will likely to form on Wednesday during the London or New York sessions.

Consolidation Thursday Bullish Reversal

In bullish trends, prices might consolidate from Monday to Wednesday. After forming the weekly low, prices rebound upward.

To understand this pattern, identify **discount levels** on higher timeframes.

If prices fail to reach these levels earlier, a potential drop may **occur** on **Thursday**, coinciding with economic news or interest rate announcements near the end of the New York session.

Market's bullish reversal on Thursday following consolidation in the Weekly Profile model

Consolidation Thursday Bearish Reversal

In bearish trends, prices might **consolidate** from Monday to Wednesday within a defined range; After breaching the weekly high, price will turn into downward.

To detect this, focus on **premium levels** on higher timeframes. If these levels aren't reached earlier, a possible price increase on Thursday might precede a drop, typically triggered by news events or interest rate decisions in the late New York session.

Consolidation Midweek Rally

In bullish markets, prices **consolidate** from Monday to Wednesday, then breach the **weekly high** and **continue** upward until Friday.

If prices fail to reach the **premium level** or break past the discount level, they are likely poised to rise toward the premium level and continue their rally.

Consolidation Midweek Decline

In bearish markets, prices **consolidate** from Monday to Wednesday, followed by further declines until Friday after reaching the weekly low.

If prices drop from the **premium level** without hitting the discount level and lack signs of a bullish reversal, this indicates continued downward momentum toward the discount level on higher timeframes.

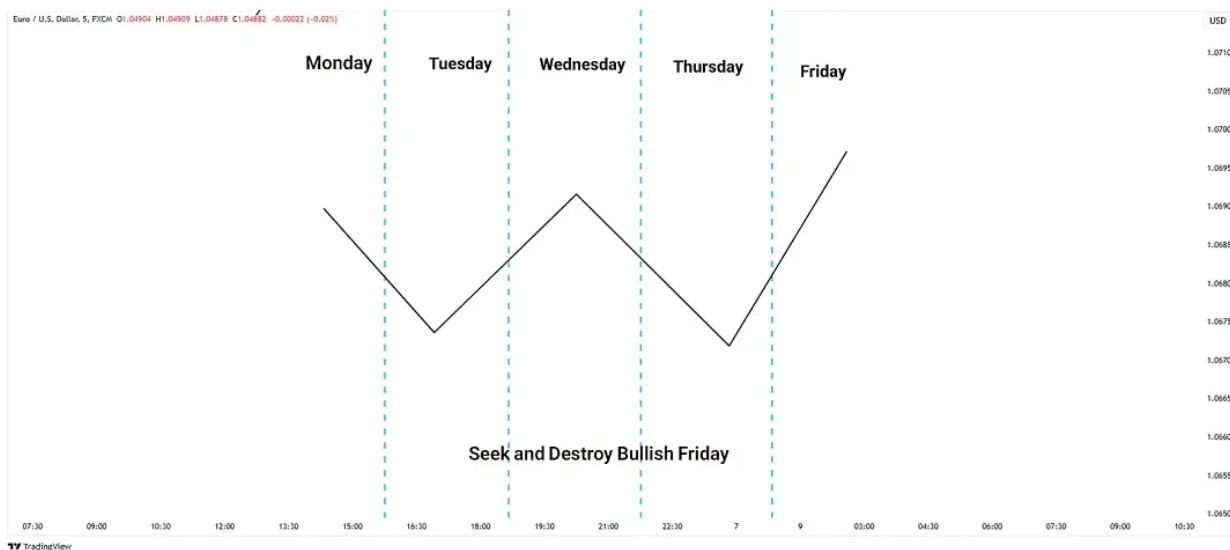

Pattern of midweek price decline following consolidation (Consolidation Midweek Decline) in the Weekly Profile model

Seek and Destroy Bullish Friday

The market may **consolidate** from Monday to Thursday in bullish trends, **activating** small stops above and below the weekly highs.

Prices then breach the weekly high and continue rising until Friday.

This pattern often occurs when the market awaits interest rate **announcements** or **employment** reports, typically during summer months.

Schematic representation of the low-probability bullish Friday profile (Neutral-Low Probability Profile) in the Weekly Profile model

Neutral-Low Probability Profile

The price will likely remain **neutral** from Monday to Thursday in range markets, activating small stops above and below weekly highs.

Then, price will move toward the weekly low and **continue** declining until Friday.

This **behavior** often happens when the market awaits key events like interest rate announcements or employment reports.

Wednesday Weekly Bullish Reversal

In this pattern, the market consolidates from Monday to Tuesday. By Wednesday, price will drop to the **discount level**, activating sell stops before quickly rebounding and initiating a strong bullish move.

This scenario occurs when the market approaches significant **long-term** or **mid-term lows**, where institutional buying combines with **selling liquidity** to trigger **upward** momentum.

Wednesday Weekly Bearish Reversal

In bearish trends, prices may consolidate from Monday to Tuesday. On Wednesday, they rise toward the **premium level** on higher timeframes to activate buy stops.

This rise creates an opportunity for institutional **selling**, leading to a strong bearish reversal.

Conclusion

Weekly Profiles (Master ICT Weekly Profiles) are frameworks for **identifying price movement** patterns throughout a trading week.

These profiles include scenarios like **bullish** and **bearish** trends, **midweek reversals**, and **consolidations**.

By analyzing these profiles, traders can predict **weekly highs** and **lows** based on price behavior during **specific** days (e.g., Monday to Wednesday).
