The **Breaker Block** is one of the concepts in the **ICT trading style**. This method focuses on the **break of Order Blocks** (OB) and their **transformation** into **new zones** for **price retracement**, creating an entry area for trading based on the **Breaker Block (BB) strategy**.

What is a Breaker Block?

A Breaker Block is an **Order Block** (OB), broken **by price**, which transforms into a **new support** or **resistance** zone for price **retracements**. This shift usually occurs due to a **Liquidity Sweep** and a **Market Structure Shift (MSS)**.

Types of Breaker Blocks

Breaker Blocks (BB) exist in two forms:

- ⚡ **Bullish**
- ⚡ **Bearish**

Bullish Breaker Block

A **bearish Order Block** (OB-) is broken by an **upward** price movement. After the break, it shifts to act as a **support** zone, aiding further price increases.

Bearish Breaker Block

A bullish Order Block (OB+) is broken by a **downward** price movement. After the break, it shifts to act as a **resistance** zone, aiding further price decreases.

Principles for Identifying a Breaker Block (BB)

To validate a Breaker Block, the following points should be assessed:

- ⚡ **Liquidity Sweep:** At first, price will capture **liquidity** located behind a specific zone
- ⚡ **Order Block Break:** Price breaches the upper limit (in bearish OB) or lower limit (in bullish OB), invalidating it
- ⚡ **Market Structure Shift (MSS):** A confirmed trend reversal (from bullish to bearish or vice versa) must occur

Step-by-Step Guide for Trading with Breaker Blocks

To execute the Breaker Block trading strategy, follow the steps below:

#1 Identify the Market's Overall Trend

Determine the market's overall **direction** using higher timeframes to ensure your BB aligns with the **main trend**.

#2 Wait for a Liquidity Sweep

Wait for the price to move toward a **liquidity pool**, absorb it, and then **reverse**.

#3 Identify the Order Block Break (OB)

When the price breaks an Order Block, it will turn into a **Breaker Block (BB)**:

- ⚡ If the price closes above a bearish Order Block, a **Bullish Breaker Block** forms
- ⚡ If the price closes below a bullish Order Block, a **Bearish Breaker Block** forms

#4 Enter the Trade

Once the Breaker Block area forms, wait for the price to **retrace** to this zone and enter the trade with MSS or CHoCH **confirmation** signals.

- ⚡ **Stop Loss (SL):** Slightly below the BB area
